System Release 4.2

Accuracy

While reasonable efforts have been made to assure the accuracy of this document, Cambium Networks assumes no liability resulting from any inaccuracies or omissions in this document, or from use of the information obtained herein. Cambium reserves the right to make changes to any products described herein to improve reliability, function, or design, and reserves the right to revise this document and to make changes from time to time in content hereof with no obligation to notify any person of revisions or changes. Cambium does not assume any liability arising out of the application or use of any product, software, or circuit described herein; neither does it convey license under its patent rights or the rights of others. It is possible that this publication may contain references to, or information about Cambium products (machines and programs), programming, or services that are not announced in your country. Such references or information must not be construed to mean that Cambium intends to announce such Cambium products, programming or services in your country.

Copyrights

This document, Cambium products, and 3rd Party software products described in this document may include or describe copyrighted Cambium and other 3rd Party supplied computer programs stored in semiconductor memories or other media. Laws in the United States and other countries preserve for Cambium, its licensors, and other 3rd Party supplied software certain exclusive rights for copyrighted material, including the exclusive right to copy, reproduce in any form, distribute and make derivative works of the copyrighted material. Accordingly, any copyrighted material of Cambium, its licensors, or the 3rd Party software supplied material contained in the Cambium products described in this document may not be copied, reproduced, reverse engineered, distributed, merged or modified in any manner without the express written permission of Cambium. Furthermore, the purchase of Cambium products shall not be deemed to grant either directly or by implication, estoppel, or otherwise, any license under the copyrights, patents or patent applications of Cambium or other 3rd Party supplied software, except for the normal non-exclusive, royalty free license to use that arises by operation of law in the sale of a product.

Restrictions

Software and documentation are copyrighted materials. Making unauthorized copies is prohibited by law. No part of the software or documentation may be reproduced, transmitted, transcribed, stored in a retrieval system, or translated into any language or computer language, in any form or by any means, without prior written permission of Cambium.

License Agreements

The software described in this document is the property of Cambium and its licensors. It is furnished by express license agreement only and may be used only in accordance with the terms of such an agreement.

High Risk Materials

Cambium and its supplier(s) specifically disclaim any express or implied warranty of fitness for any high-risk activities or uses of its products including, but not limited to, the operation of nuclear facilities, aircraft navigation or aircraft communication systems, air traffic control, life support, or weapons systems ("High Risk Use"). Any High Risk is unauthorized, is made at your own risk and you shall be responsible for any and all losses, damage or claims arising out of any High-Risk Use.

Upgrade/Downgrade Guidelines

Section-1

Mandatory image extension verification to follow while upgrade/downgrade from **4.x to 4.x, 3.11.x to 4.x and vice versa**. This procedure is applicable on cnMaestro (On-Premise recommended version is 2.2.1-r36 and above) and standalone AP UI/CLI. This procedure will **not be applicable on cnMaestro-Cloud**, since image upgrade/downgrade is automatic for APs.

Note

This recommendation is applicable for all models of cnPilot APs.

Refer the below table and validate the **image extension** w.r.t the version before proceeding to upgrade/downgrade.

Version		Image extension
From	To	
4.x	4.x	CIMG
4.x	3.11.x	IMG
3.11.x	4.x	**IMG

**Note

For **cnPilot e410/e430/e510/e600 and e700** APs, refer additional instructions mentioned in before proceeding to upgrade/downgrade.

Section-2

Attention

To upgrade/downgrade from 3.11.x (3.11.4-r9 /3.11.3.1-r4/3.11.3-r7 etc.) to 4.x (4.0/4.1/4.2 and later subsequent images) and vice versa, mandatorily use 3.11.4.1-r3 and 4.1-r3 and above image versions. Ignoring this suggestion can lead to failure in loading the image and resulting in flashed partition (backup partition) getting corrupted. To recover the corrupted partition, user may have to contact Cambium Support team.

Perform the below steps to upgrade image from 3.11.4-r9 to 4.1.1-r3 and above:

1. First upgrade the AP from **3.11.4-r9** to **3.11.4.1-r3**
2. Then upgrade the AP from **3.11.4.1-r3** to **4.1.1-r3** and above

Perform the below steps to upgrade image from **4.1.1-r3** and above to **3.11.4-r9**:

1. First downgrade the AP from **4.1.1-r3** and above to **3.11.4.1-r3**
2. Then downgrade the AP from **3.11.4.1-r3** to **3.11.4-r9**

Note

This recommendation is only applicable for **cnPilot e410/e430/e510/e600 and e700**.

Chapter 1: About This User Guide

This chapter describes the following topics:

- [Overview of cnPilot products](#)
- [Intended audience](#)
- [Purpose](#)
- [Related documents](#)
- [Features and Enhancements](#)
- [New platforms](#)

Overview of cnPilot products

Thank you for choosing Cambium cnPilot Access Point (AP)!

This User Guide describes the features supported by cnPilot Enterprise AP and provides detailed instructions for setting Up and configuring cnPilot Enterprise AP.

cnPilot's are the industry's upcoming feature-rich Wi-Fi APs designed for Indoor/Outdoor which are easy to deploy and configure.

Intended audience

This guide is intended for use by the system designer, system installer and system administrator.

Purpose

Cambium Network's cnPilot Enterprise AP documents are intended to instruct and assist personnel in the operation, installation and maintenance of the Cambium's equipment and ancillary devices. It is recommended that all personnel engaged in such activities be properly trained.

Cambium disclaims all liability whatsoever, implied or expressed, for any risk of damage, loss or reduction in system performance arising directly or indirectly out of the failure of the customer, or anyone acting on the customer's behalf, to abide by the instructions, system parameters, or recommendations made in this document.

Features and Enhancements

System Release 3.11.4

System release 3.11.4 includes the following enhancements:

Table 3 New features

Features	Platform Support	Summary
VAN support	e600	ZTE 4G dongle is supported as a WAN link in cnPilot e600.
Auto-RF	All	Auto-RF enhancements.
System	All	Provision to disable factory reset due to continuous power outages.
System	All	Provision to honor MTU learnt from DHCP option 26.

System Release 4.0

System release 4.0 includes the following new features:

Table 4 New features

Features	Platform Support	Summary
GRE over UDP	All	Layer 3 GRE tunnel support with any standard vendor.
Cambium GRE	All	Layer 3 GRE tunnel support with Cambium cnMaestro c4000 Controller and c4000 Concentrator.
IPv6	All	Support for IPv6 protocol.
LACP	e600	Link aggregation support.
BLE Location API	e600, e430 and e700	Discover neighbor Bluetooth device.

System release 4.0 includes the following enhancements:

Table 5 Enhancements

Features	Platform Support	Summary
RADIUS attributes	All	Added multiple parameters as per RFC to meet customer requirements.
ACL	All	Improved the efficiency of throughput when ACL is enabled.
Syslog	All	Added multilevel debugging capability.

Supported hardware platforms

Table 6 Supported platforms

Hardware	Description
E400	2x2:2, 802.11a/b/g/n/ac wave 1 indoor Access Point
E500	2x2:2, 802.11a/b/g/n/ac wave 1 outdoor Access Point
E501S	2x2:2, 802.11a/b/g/n/ac wave 1 90°/120° outdoor Access Point
e502S	2x2:2, 802.11a/b/g/n/ac wave 1 30° outdoor Access Point
e410	2x2:2, 802.11a/b/g/n/ac wave 2 indoor Access Point
e510	2x2:2, 802.11a/b/g/n/ac wave 2 outdoor Access Point
e600	2x2:2 for 2.4 GHz and 4x4:4 for 5 GHz, 802.11a/b/g/n/ac wave 2 indoor Access Point
e430	2x2:2, 802.11a/b/g/n/ac wave 2 indoor Access Point
e700	2x2:2 for 2.4 GHz and 4x4:4 for 5 GHz, 802.11a/b/g/n/ac wave 2 indoor Access Point

New hardware platforms

System release 4.2 includes the following new Platforms:

Table 7 New platforms

Hardware	Description
e410b	2x2:2, 802.11a/b/g/n/ac wave 2 Indoor Access Point.

Chapter 2: Quick Start – Device Access

This chapter describes the following topics:

- **Powering up the device**
- **Accessing the device**
- **LED status**

Powering up the device

This section includes the following topics:

- **PoE switches (802.3af/802.3at)**
- **PoE adapter**

cnPilot product family can be powered either using PoE adapter provided in the package or it can be powered using 802.3af or 802.3at capable switches.

For cnPilot e600 and e430, there is additional provision to power ON device using DC power adapter.

PoE switches (802.3af/802.3at)

All devices can be powered by PoE switches supplying standard 802.3af or 802.3at power. The following restrictions apply if 802.3af power is used:

- On cnPilot E501S and e502S along with E500, e430 and e425H the PoE out feature will not be operational.
- On cnPilot e600, radio transmit power will be limited to 17dBm and the USB port will not be operational.
- On cnPilot e700, the radio transmit power will be limited to 17dBm and PoE out feature will not be operational.

To avoid these restrictions, power the device using 802.3at capable switches. In addition, 802.3af / 802.3at switches do not supply sufficient power to use the PoE out feature on cnPilot e700. Use a power injector such as the 60W Cambium N000065L001C Gigabit power injector when operating with this feature enabled.

To power ON the cnPilot device, connect Eth1 of device to PoE switch port. **Figure 1** displays how cnPilot e430 connects to a PoE capable switch.

Figure 1 Installation of cnPilot to PoE capable switch

PoE adapter

Follow the below procedure to power up the device using PoE adapter (**Figure 2**):

1. Connect the Ethernet cable from Eth1/PoE-IN of the device to the PoE port of Gigabit Data + Power.
2. Connect an Ethernet cable from your LAN or Computer to the Gigabit Data port of the PoE adapter.

Figure 2 Installation of cnPilot to PoE adapter

Note

1. If Auxiliary port is used to power a secondary device, the maximum cable length between AP and the secondary device is 5 meters.
2. Secondary device is allowed to install 0.6 meters below the highest point on the metal mounting pole.
3. If Auxiliary port is used for only LAN connection between AP and secondary device. If cable length exceeds 5 meters or if the secondary device is installed on a different pole, then additional gigabit surge suppressor is recommended between AP and Secondary device.

3. Connect the power cord to the adapter, and then plug the power cord into a power outlet as shown in **Figure 3**. Once powered **ON**, the Power LED should illuminate continuously on the PoE Adapter.

Figure 3 Installation of adapter to power outlet

Accessing the device

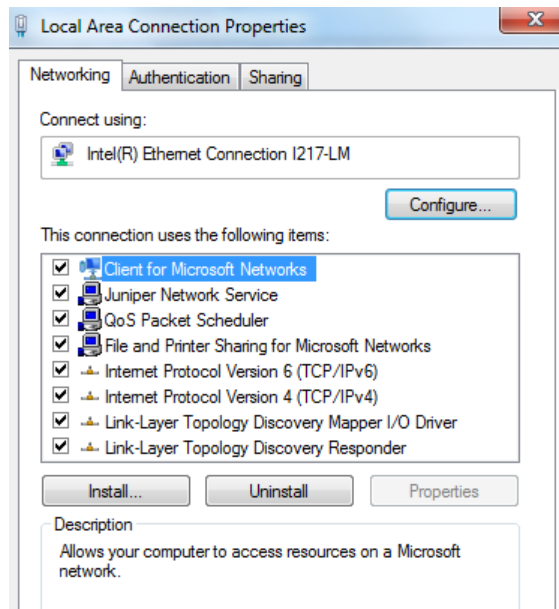

This section includes the following topics:

- [Device access using default/fallback IP](#)
- [Device access using zeroconf IP](#)
- [Device access using DHCP IP address](#)

Once the device is powered up ensure the device is up and running before you try to access it based on LED status. Power LED on the cnPilot device should turn Green which indicates that the device is ready for access.

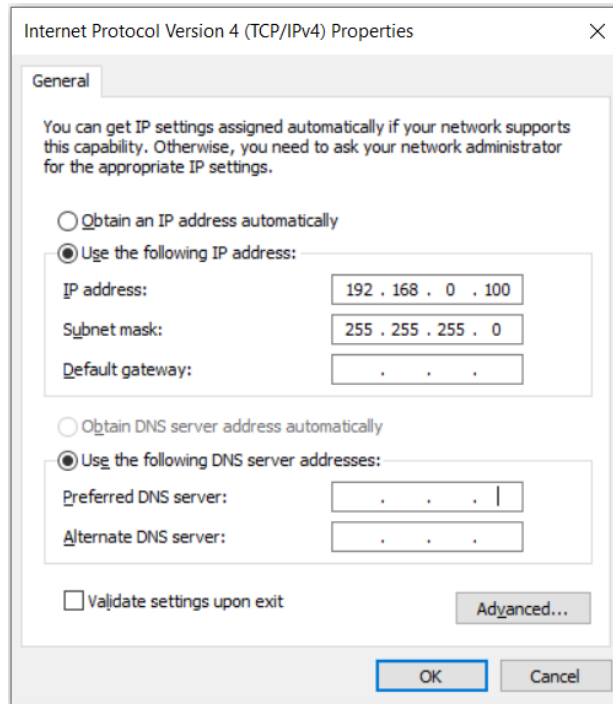

Device access using default/fallback IP

1. Select **Properties** for the Ethernet port:
 - a) For Windows 7: **Control Panel > Network and Internet > Network Connections > Local Area Connection**
 - b) For Windows 10: **Control Panel > Network and Internet > Network and Sharing Center > Local Area Connection**

2. IP Address Configuration:

The cnPilot AP obtains its IP address from a DHCP server. A default IP address of **192.168.0.1/24** will be used if an IP address is not obtained from the DHCP server.

Open any browser on the PC and browse <http://192.168.0.1> with default credentials as below:

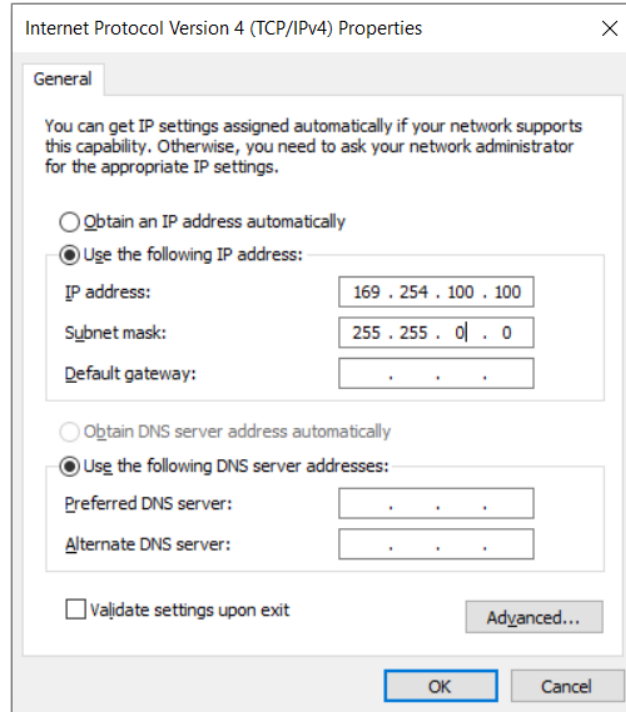

- Username: admin
- Password: admin

Device access using zeroconf IP

To access the device using zeroconf IP, follow the below steps:

For example:

- Convert the last two bytes of ESN of the device to decimal. If ESN is **58:C1:CC:DD:AA:BB**, last two bytes of this ESN is **AA:BB**. Decimal equivalent of AA:BB is **170:187**.
- Zeroconf IP of device with ESN **58:C1:CC:DD:AA:BB** is **169.254.170.187**
- Configure Management PC with **169.254.100.100/16** as below:

d) Access the device UI using <http://169.254.170.187> with default credentials as below:

- Username: admin
- Password: admin

Device access using DHCP IP address

1. Plug in the device to the network.
2. Get the IP address of the device from the System administrator.
3. Access device UI using <http://<IP address>> with default credentials as below:
 - Username: admin
 - Password: admin

LED status

The **e410/e410b/e430/e425H/e600/e505** AP has single color LED. The power LED will glow Amber as the AP boots up and turn Green once it has booted up successfully. The network/status LED will glow Amber if the connection to cnMaestro controller/manager is down and turns Blue once the AP is connected successfully to cnMaestro.

Table 8 e410/e410b/e430/e425H/e600/e505 LED status

LED Color	Status Indication
	<ul style="list-style-type: none"> Device is booting up.  <div style="border: 1px solid black; background-color: #e1f5fe; padding: 5px; margin-top: 5px;"> Note If these LEDs remain 'Amber' for more than 5 minutes, indicates that the device failed to boot. </div>
	<ul style="list-style-type: none"> Device is successfully up and accessible. Wi-Fi services are up if configured.
	<ul style="list-style-type: none"> cnMaestro connection is successful.

The **e700/e510** AP has two multi-colored LEDs. The power LED will glow Amber as the AP boots up and turns Green once it has booted up successfully. The network/status LED will glow Amber if the connection to cnMaestro controller/manager is down and turns Blue once the AP is connected successfully to cnMaestro.

Table 9 e700/e510 LED status

LED Color		Status Indication
		
		<ul style="list-style-type: none"> Device is booting up.  <div style="border: 1px solid black; background-color: #e1f5fe; padding: 5px; margin-top: 5px;"> Note If these LEDs remain 'Amber' for more than 5 minutes, indicates that the device failed to boot. </div>
		<ul style="list-style-type: none"> Device is successfully up and accessible. Wi-Fi services are up if configured.
		<ul style="list-style-type: none"> Device is successfully up and accessible. Wi-Fi services are up if configured. cnMaestro connection is successful.

The **E400/E500/E501S/e502S** AP has two multi-colored LEDs. The power LED will glow Amber as the AP boots up and turns Green once it has booted up successfully. The network/status LED will glow Amber if the connection to cnMaestro controller/manager is down and turns Green once the AP is connected successfully to cnMaestro.

Table 10 E400/E500/E501S/e502S LED status

LED Color		Status Indication
		
		<ul style="list-style-type: none"> Device is booting up. <div style="border: 1px solid black; background-color: #e1f5fe; padding: 5px; display: inline-block;"> <p>Note If these LEDs remain 'Amber' for more than 5 minutes, indicates that the device failed to boot.</p> </div>
		<ul style="list-style-type: none"> Device is successfully up and accessible. Wi-Fi services are up if configured.
		<ul style="list-style-type: none"> Device is successfully up and accessible. Wi-Fi services are up if configured. cnMaestro connection is successful.

Chapter 3: Device Modes

cnPilot product family supports three modes of operation based on deployment size. Details of mode of operation supported by cnMaestro are given below:

- **cnMaestro managed mode**
- **Autopilot mode**
- **Standalone mode**

cnMaestro managed mode

This mode is also known as controller mode, in which all management traffic is tunneled to cnMaestro and data traffic is offloaded from AP to the network. There are provisions to tunnel data traffic to cnMaestro but has its own limitations w.r.t size of deployment. Device onboarding methods and procedures are explained in further chapters. By default, devices onboard to cnMaestro cloud (<https://cloud.cambiumnetworks.com>), however we can also onboard the devices to cnMaestro On-Premises by mapping the cnMaestro IP address on the device.

Note cnMaestro managed mode is the recommended mode for any cnPilot devices.

Autopilot mode

This is a proprietary mode supported by cnPilot devices. This mode allows one of the cnPilot devices to act as controller, which allows to configure other devices in the network. This mode has its own limitations, which will be explained in detail in the following chapters.

Standalone mode

This is the default mode a cnPilot device operates. In this mode, it is expected that each device has to be configured and managed independently, which is cumbersome if deployment size exceeds 10 devices.

Chapter 4: cnMaestro Onboarding

This chapter describes the following topics:

- [Overview](#)
- [Device Onboarding and Provisioning](#)
- [Directing devices to the cnMaestro On-Premises server](#)
- [Claim using Cambium ID](#)

Overview

cnMaestro is Cambium's next generation network management platform based on cloud technologies. In addition to the cloud-based cnMaestro solution, it can also be installed as a standalone On-Premises server. By default, all devices contact <https://cloud.cambiumnetworks.com>, no user action is required to direct devices to contact cnMaestro cloud. You can onboard and provision devices without any additional setup.

If you are using cnMaestro On-Premises you must direct devices to correct cnMaestro server using DHCP or static URL configuration.

Device Onboarding and Provisioning

This section includes the following topics:

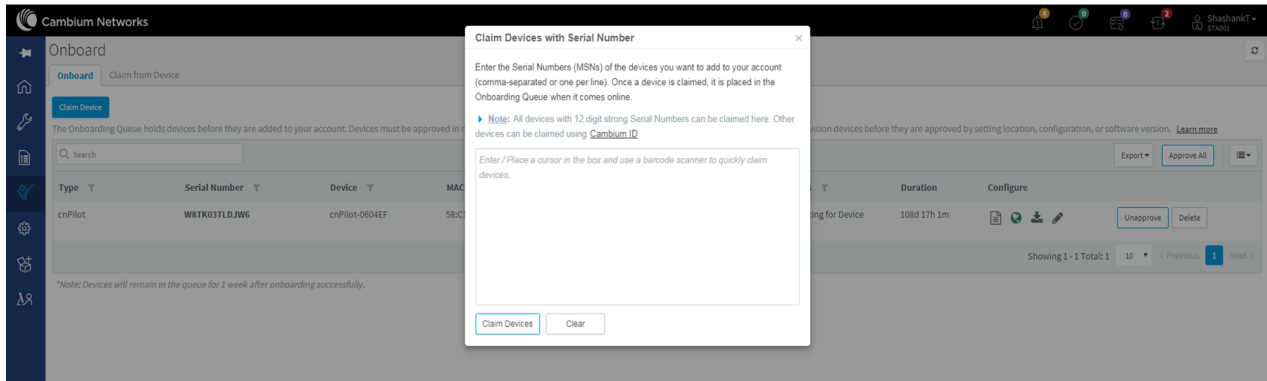

- [Onboarding to cnMaestro cloud using MSN](#)
- [Onboarding to cnMaestro On-Premises](#)
- [Auto-Provisioning](#)
- [Other options](#)

Onboarding to cnMaestro cloud using MSN

This mode is preferable for cnMaestro cloud. In order to claim through MSN Address, follow the below steps:

1. Login to On-Premises server using default username and password (admin/admin) or the username and password set by the Administrator.
2. Navigate to **Home > Onboard Devices > Claim from cnMaestro**.
3. Select the **Device type** that needs to be onboarded and provide the MSN in the combo box and click the **Claim Devices button**. Multiple MSN Addresses of same device type can be claimed using (,) separator between MSN or by entering them in the new line.

Figure 4 Onboarding to cnMaestro cloud using MSN

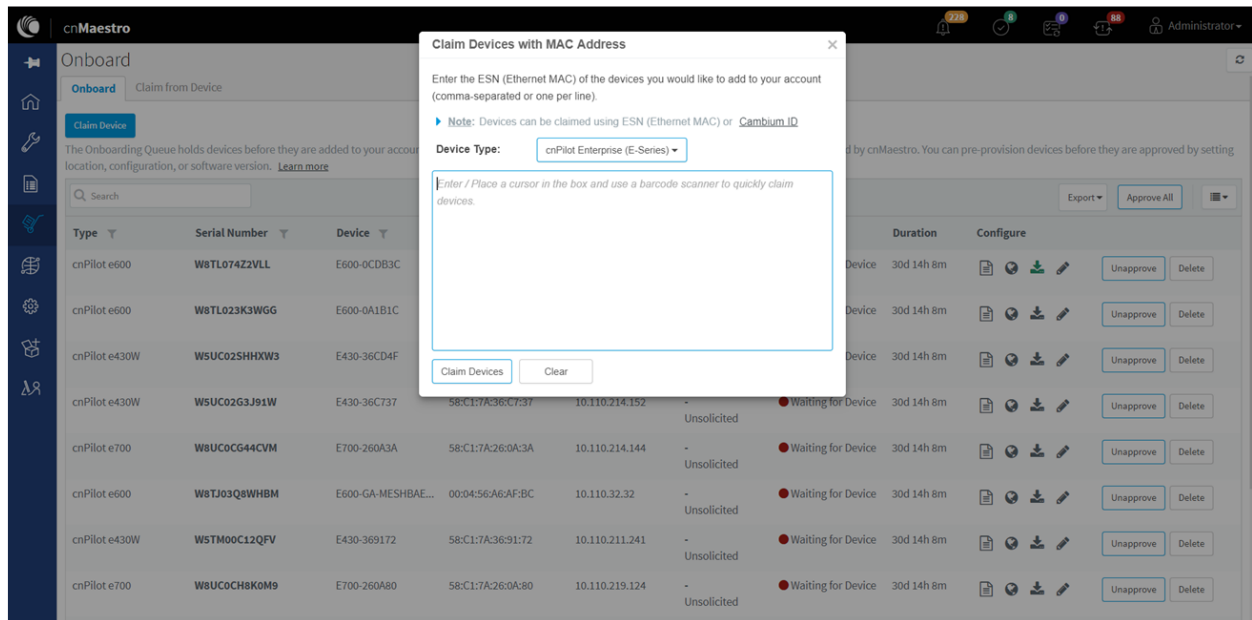

Onboarding to cnMaestro On-Premises

This mode is preferable for cnMaestro On-Premises. In order to claim through MAC Address (ESN), please follow the below steps:

1. Login to On-Premises server using default username and password (admin/admin) or the username and password set by the Administrator at the time of On-Premises server installation.
2. Navigate to **Home > Onboard Devices > Claim from cnMaestro**.
3. Select the **Device type** for which onboarding is to be done and provide the MAC Address in the combo box and click the **Claim Devices button**. Multiple MAC Addresses of same device type can be claimed using (,) separator between MAC Addresses or by entering them in the new line.

Figure 5 Onboarding to cnMaestro On-Premises

Auto-Provisioning

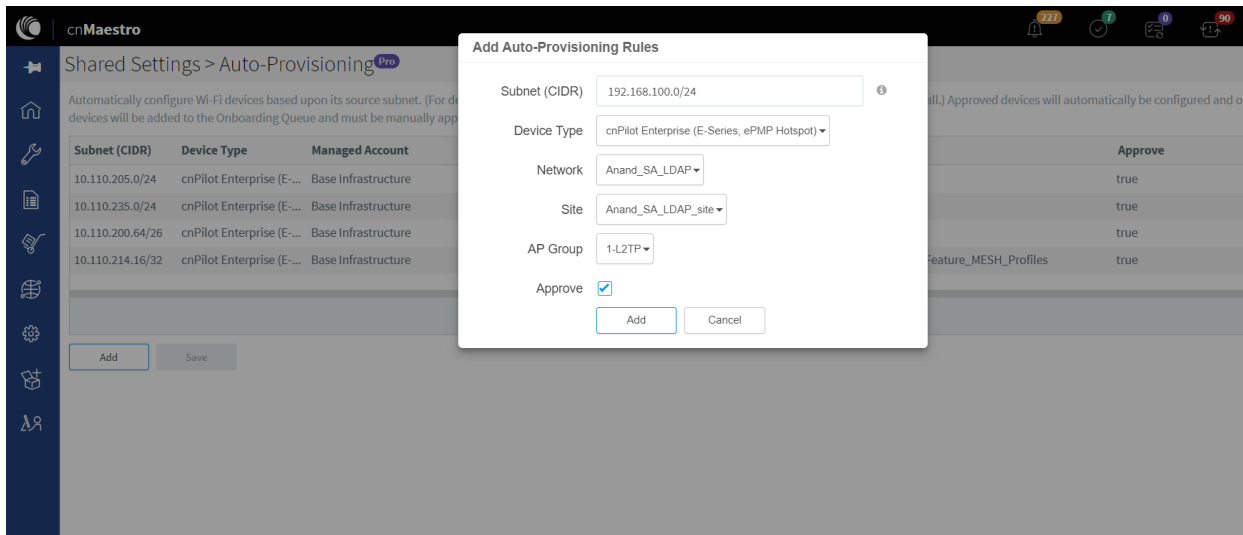

cnMaestro On-Premises supports Auto-Provisioning for cnPilot devices. This feature not only enables auto onboarding but also configures synchronization and positioning of device in the network architecture. It is triggered only at first instance of device onboarding. It can be configured on cnMaestro as below:

Configuration

It is enabled at **Shared Settings > Auto-Provisioning**, and it allows one to automatically configure and approve devices based upon IP address. To create rules for cnPilot devices:

1. Navigate to **Shared Settings > Auto-Provisioning** page.
2. To create a new rule, click **Add**. The following window appears:

Figure 6 Auto-Provisioning

3. Enter the following details given in **Table 8**:

Table 11 Auto-Provisioning parameter details

Parameter	Description
Subnet (CIDR)	The subnet with CIDR of the devices to which the rule has to be applied. For example, Subnet/CIDR (192.168.100.100/25) maps the devices with the IP addresses ranging from 192.168.100.1 to 192.168.100.126.
Device Type	Select the type of the device from the drop-down list.
Network	Select the network to which the device should be onboarded, once the device contacts the server.
Site	Select the site under which the device should be onboarded, once the device contacts the server.
AP Group	Select the AP Group which needs to be applied on the device, once the device contacts the server while onboarding.

Parameter	Description
Approve	Enables this option to auto-approve onboarding.

- Click **Add**.

Note Auto-Provisioning is supported only for cnMaestro On-Premises and not for cnMaestro cloud.

Other options

This section includes the following topics:

- [AP Group](#)
- [Site dashboard](#)

The device onboarding screen can also be accessed from other locations in the UI. Below options can be used in both cloud cnMaestro and cnMaestro On-Premises. For cnMaestro On-Premises, ESN/MAC Address is required for onboarding/claiming device in an account whereas for cloud cnMaestro MSN is required to claim/onboard device in an account.

AP Group

In order to claim multiple devices from the AP Group in cloud, navigate to the Wi-Fi AP Groups tree view and click the drop-down menu for the selected AP Group.

- Click the **Claim Devices** option.
- In the pop-up dialog, select the **Network and Site** under which these devices needs to be placed and by default the devices claimed under this group will have the configuration settings from this AP Group.
- Specify the MSNs/ESNs (Manufacturing Serial Number) of the devices line-by-line or comma-separated or click **Import .csv** option to **import the MSNs/ESNs** of the devices from a file.
- Click **Claim Devices** to add to the selected AP Group with the configuration applied.

Note In cnMaestro On-Premises the procedure to claim the device using Serial Number is same as cloud, but instead of MSN, the user should use the device MAC Addresses.

Figure 7 Claiming the device using MAC address (ESN)

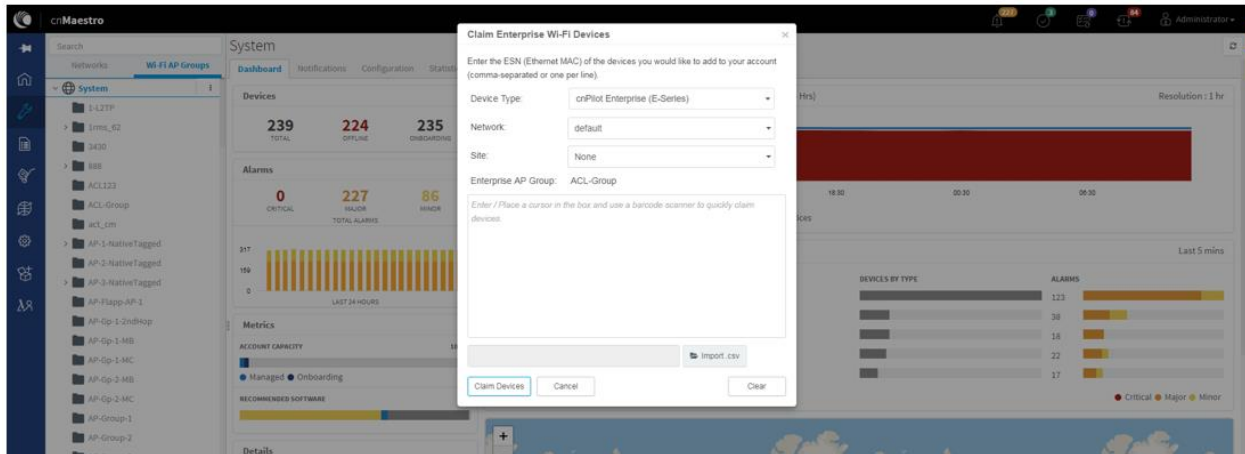

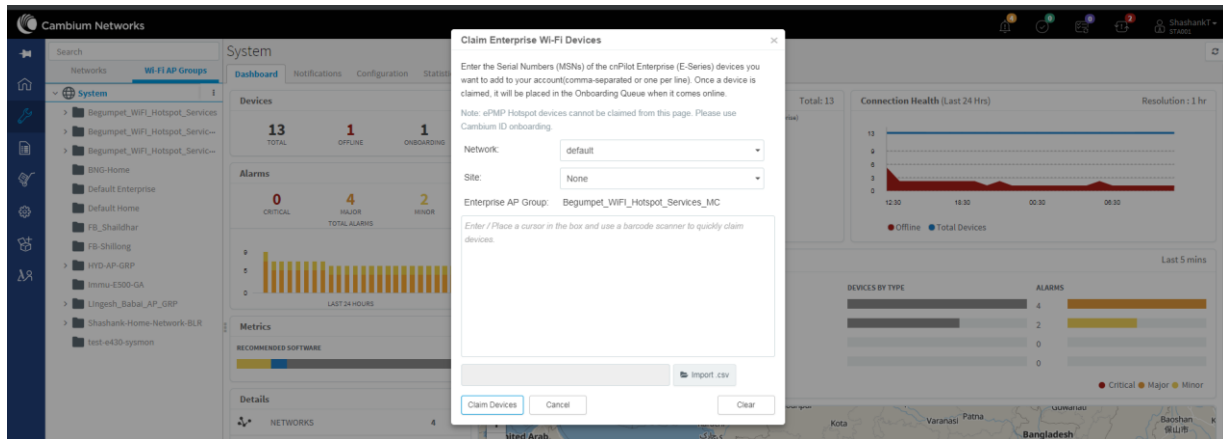

Figure 8 Claiming the device using Serial Number (MSN)

Site dashboard

In order to claim multiple devices from the Site dashboard in cloud, navigate to the **Manage** section and select a site under a network and click the drop-down menu for the selected site:

1. Click the **Claim Devices** option.
2. In the pop-up dialog, select the **Network and Site** under which these devices needs to be placed and by default the devices claimed under this group will have the configuration settings from this AP Group.
3. Specify the MSNs (Manufacturing Serial Number) /ESNs (Equipment Serial Number) of the devices line-by-line or comma-separated or click **Import .csv** option to **import the MSNs/ESNs** of the devices from a file.
4. Click **Claim Devices** to add to the selected AP Group with the configuration applied.

Note Claim using MAC address is supported by cnMaestro On-Premises only.

Figure 9 Claim the device using MAC address

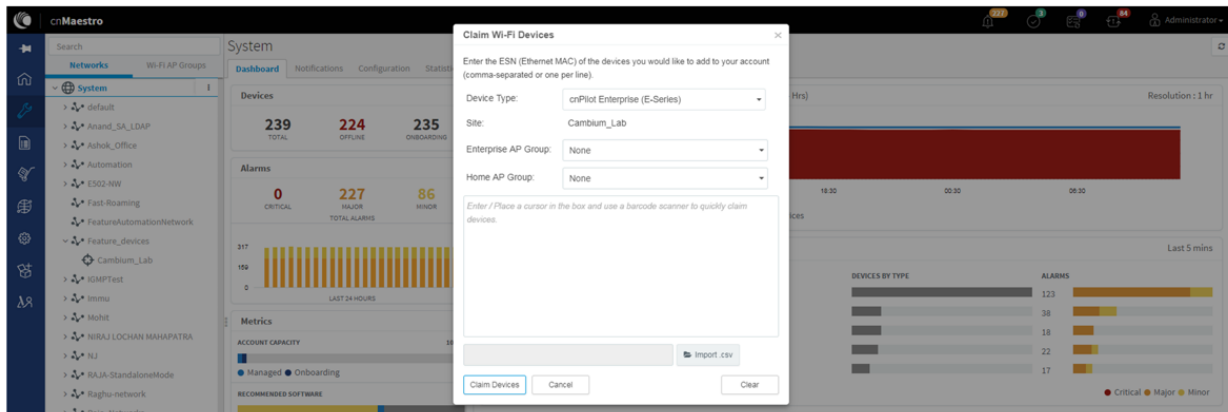

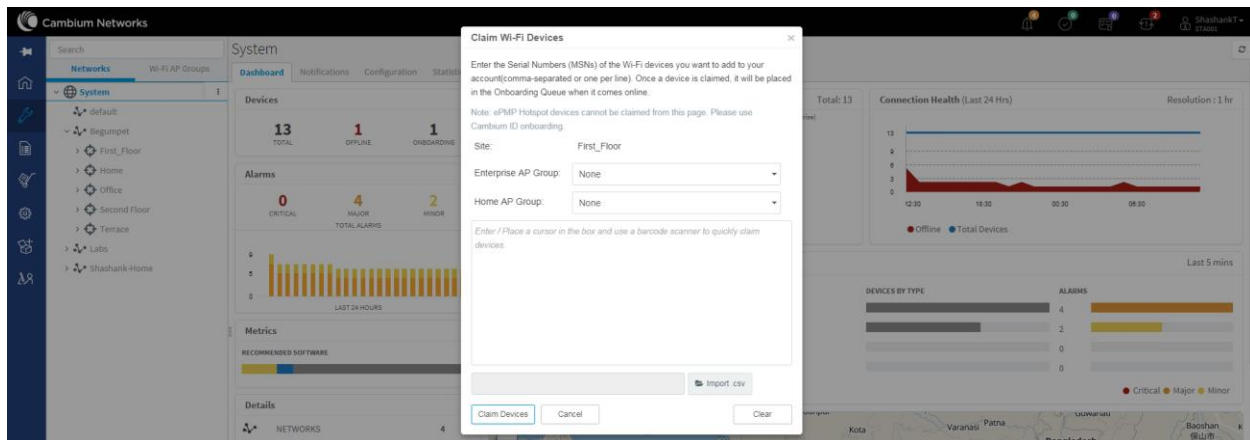

Figure 10 Claim the device using MSN

Directing devices to the cnMaestro On-Premises server using DHCP

From cnPilot system release 4.0, cnPilot device can be onboarded either using IPv4/IPv6 DHCP options. Following are the options that are used in IPv4 and IPv6 respectively:

- **IPv4**
 - DHCP Option 43/52
 - DHCP Option 15/24
- **IPv6**
 - DHCP Option 43/52
 - DHCP Option 15/24

DHCP Option 43/52

This mode of onboarding is preferred to use when cnMaestro On-Premises is deployed at customer end. cnPilot reads Option 43/52 during DHCP transaction and then it connects to respective cnMaestro. This option is given high priority during cnMaestro discovery process. All these devices which have read the Option 43/52 from DHCP transaction are available in Queue on cnMaestro, which needs to be further approved by end user.

Figure 11 DHCP option 43/52

Type	Serial Number	Device	MAC	IP Address	Added By	Status	Duration	Configure
cnPilot e400	W8SA01760R4L	E400-AFCAC6	00:04:56:AF:CA:C6	10.110.219.70	-	Waiting for Appr...	0d 3h 50m	[Approve] [Delete]
cnPilot e430W	WSTM001KSKFN	E430-369519	58:C1:7A:36:95:19	10.110.219.73	-	Waiting for Appr...	0d 5h 27m	[Approve] [Delete]
cnPilot e700	W8UC0CCKTGHF	E700-2609B0	58:C1:7A:26:09:B0	10.110.219.69	-	Waiting for Appr...	0d 7h 5m	[Approve] [Delete]

DHCP server configuration

More details on various DHCP server configuration for Option 43/52 is available in Cambium Knowledge Base (KB) section.

Windows server configuration

For Windows server configuration for onboarding devices to cnMaestro On-Premises server, please click the below URL.

<http://community.cambiumnetworks.com/t5/cnMaestro/Device-Onboarding-and-Windows-DHCP-Options-for-cnMaestro-On/m-p/55199>

Linux server configuration

A DHCP Server can be used to configure the IP Address, Gateway, and DNS servers for Cambium devices. If you administer the DHCP Server, you can also configure DHCP Options that will tell the devices how to access the cnMaestro (so the URL doesn't need to be set on each device).

<http://community.cambiumnetworks.com/t5/cnMaestro/Device-Onboarding-and-Linux-DHCP-Options-for-cnMaestro-On/m-p/55187>

Microtik server configuration

For Microtik Routerboard DHCP configuration for onboarding devices to cnMaestro On-Premises server, please click the below link.

<http://community.cambiumnetworks.com/t5/cnMaestro/Microtik-Routerboard-DHCP-configuration-for-Onboarding-devices/m-p/56012>

Claim using Cambium ID

This section includes the following topics:

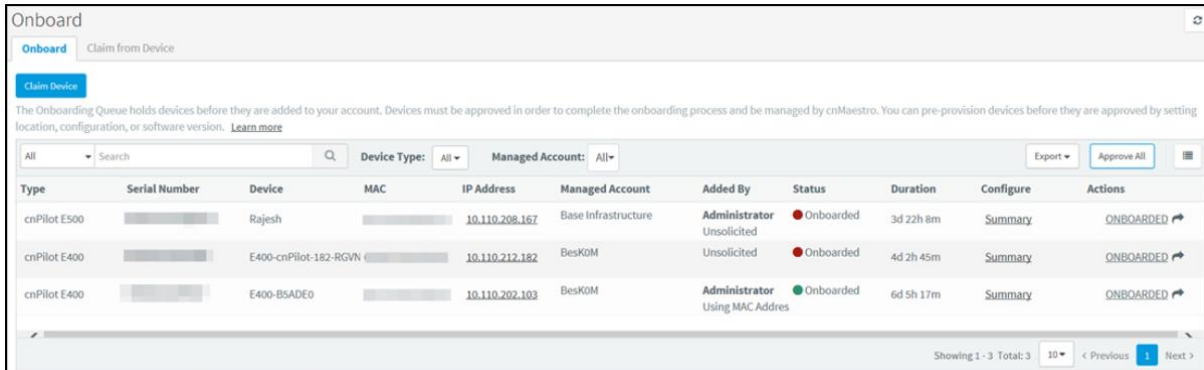

- [Claim through static URL without Cambium ID and onboarding key](#)
- [Claim through static URL with Cambium ID and onboarding key](#)

Claim through static URL without Cambium ID and onboarding key

In order to claim the devices using the static URL without Cambium ID and onboarding key please follow the below steps:

1. Login to device UI and navigate to **Configure > System > Management > cnMaestro**.
2. Provide static URL of On-Premises <https://ON-PREMISESIPADDRESSORHOSTNAME> and click **Save**.
3. Device will come to the onboarding queue in the cnMaestro **Home > Onboard Devices > Onboard** page and the user can approve the device.

Figure 13 Claim through static URL without Cambium ID and onboarding key

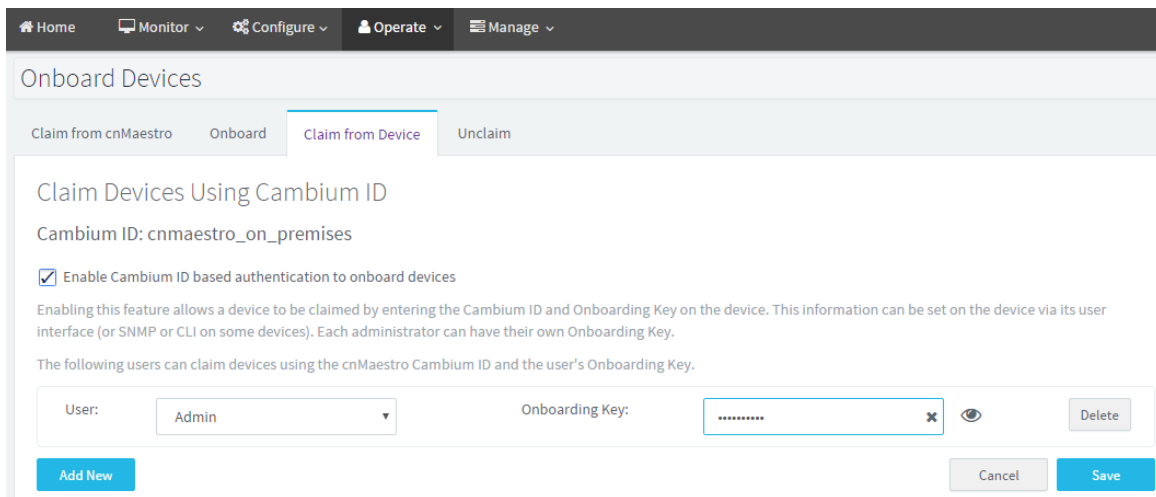

Claim through static URL with Cambium ID and onboarding key

In order to claim the devices using the static URL with Cambium ID and onboarding key, please follow the below steps:

1. Login to On-Premises server using default username and password (admin/admin) or the username and password set by the Administrator at the time of installation.
2. Navigate to **Home > Onboard Devices > Claim from Device** page.
3. Select the checkbox for “Enable Cambium ID based authentication to onboard devices”.
4. Click on **Add new** and select the username from the drop-down list and specify the onboarding key and click **Save**.
5. Login to device UI and navigate to **Configure > System > Management > cnMaestro**.
6. Provide static URL of On-Premises **https://ON-PREMISESIPADDRESSORHOSTNAME** and Cambium ID (cnMaestro_On-Premises) and onboarding key for that user and click **Save**.
7. Device will come to the onboarding queue in the cnMaestro **Home > Onboard Devices > Onboard** page and the user can approve the device.

Figure 14 Claim through static URL with Cambium ID and onboarding key

Chapter 5: UI Navigation

You can manage cnPilot device using User Interface (UI) which is accessible from any network devices such as computer, mobile, tabs, etc. cnPilot device accessibility is explained in [Chapter 3](#).

This chapter describes the following topics:

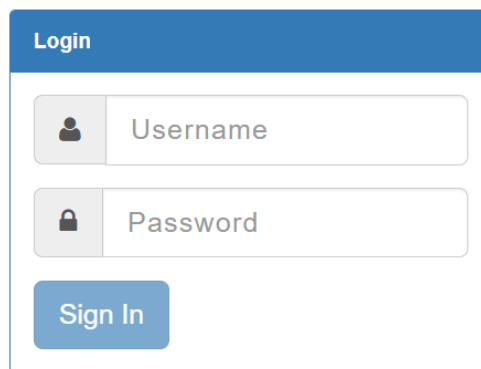

- [Login screen](#)
- [Home page \(Dashboard\)](#)

Login screen

To log to the UI, enter the following credentials:

- Username: **admin**
- Password: **admin**

Figure 15 UI Login page

The screenshot shows a login form with a blue header labeled "Login". Below the header are two input fields: "Username" with a person icon and "Password" with a lock icon. At the bottom of the form is a blue "Sign In" button.

Home page (Dashboard)

On logging into cnPilot AP login page, the UI Home page is displayed. [Figure 16](#) displays the parameters that are displayed in cnPilot AP Home page.

Figure 16 cnPilot AP UI Home page

The screenshot shows the cnPilot AP UI Home page for a Cambium Networks device (E400-AFA308). The interface includes a top navigation bar, a left sidebar, and a main content area with various status and performance metrics.

Callout 1: Points to the sidebar menu containing 'Dashboard', 'Monitor', 'Configure', 'Operations', and 'Troubleshoot'.

Callout 2: Points to the 'Reboot' button in the top right corner.

Callout 3: Points to the 'Logout' button in the top right corner.

Callout 4: Points to the 'Client Count' and 'Throughput' graphs.

Callout 5: Points to the 'Home / Dashboard' breadcrumb.

Callout 6: Points to the 'Refresh 30sec' button.

Callout 7: Points to the device name 'cnPilot E400 - E400-AFA308' in the top header.

Key UI Elements:

- Header:** Cambium Networks logo, device name 'cnPilot E400 - E400-AFA308', 'Reboot', and 'Logout' buttons.
- Navigation:** 'Home / Dashboard' breadcrumb and 'Refresh 30sec' button.
- Summary Cards:**
 - Clients:** 1 client.
 - Channel:** auto 2.4GHz, 161 5GHz.
 - Ethernet:** 1000M ETH1.
 - RF Quality:** 2.4GHz and 5GHz signal strength indicators.
- Access Point Info Table:**

Access Point Info	
MAC Address	00-04-56-AF-A3-08
Model	cnPilot E400
Software Version	3.10-r6
Location	My-Desk
Hostname	E400-AFA308
Uptime	0 days, 23 hours 27 minutes
Available Memory	58 %
CPU Utilization	19 %
Hardware Type	Dual Band Indoor Integrated
Regulatory	ROW
Serial Number	W8RM0425C22W
cnMaestro Connection Status	Connected to qa.cloud.cambiumnetworks.com
cnMaestro Account ID	211_QACLOUD_AB_FEB5
- Radio Info Table:**

Radio Info		
Type	2.4GHz	5GHz
WLANs	0	1
Clients	0	1
Channel	auto	161
Channel Width	20MHz	80MHz
Power	6	6
MAC Address	00-04-56-AF-A9-A0	00-04-56-AF-B6-20
Transmitted packets	0 pkts/sec	3 pkts/sec
Received Packets	0 pkts/sec	5 pkts/sec
Average TX	0 bps	2.7 Kbps
Average RX	0 bps	3.7 Kbps
Mesh	OFF	OFF
Radio State	OFF	ON
- Client Count Graph:** Shows the number of clients over time, with a peak at 10:22. Legend: 2.4GHz (blue), 5GHz (green), Total (red).
- Throughput Graph:** Shows throughput (bits per sec) over time, with a peak at 10:22. Legend: Transmit (blue), Receive (green).
- Wireless LAN Table:**

SSID	Security	Guest Access	Rx	Tx	Rx Packets	Tx Packets	2.4GHz State	5GHz State
\$!22l_Test_TSK...	wpa2-enterprise	enabled	5.0 Kbps	3 bps	10752	9805	OFF	ON
- Wireless Clients Table:**

SSID	Name	IP	VLAN	User	Mode	MAC	Band	Vendor	Type	SNR	Rx	Tx
\$!22l_...	Bharats-N	10.110...	1	sit-india	ac	A8-66-7F-3C-86-F8	5GHz	Apple	Apple Mac	43	3.3 Kb...	0 bps

Table 12 cnPilot AP web interface elements

Number	Element	Description
1	Menu	This section contains multiple tabs that helps user to configure, monitor and troubleshoot cnPilot device. Menu consists of the following: <ul style="list-style-type: none"> • Dashboard • Monitor • Configure • Operations • Troubleshoot
2	Reboot	Global button to reboot cnPilot device ()
3	Logout	Global button to logout user from cnPilot device ()
4	Content	Information in the area of web interface varies based on the tab selected in Menu section. Usually, this area contains details of configuration or statistics or provision to configure cnPilot device.
5	UI path	Provides UI navigation path information to user.
6	UI refresh interval	Provision to reload updated statistics at regular intervals.
7	Model number	Provides information related to cnPilot model number and configured hostname.

Monitor

The Monitor section provides information such as current configuration, traffic statistics across all interfaces configured on device and device details. Based on information provided in this section, it is categorized and displayed under following categories:

- **System:** Provides information related to cnPilot device such as Software Image, host name, Country code etc.
- **Radio:** Provides information such as RF Statistics, Neighbour list and current radio configuration of device.
- **WLAN:** Provides information on WLANs and Mesh configurations.
- **Network:** Provides information related to interfaces such as, default route, interface statistics, etc.
- **Services:** Provides information related to entities that support Bonjour.

Configure

This section allows user to configure cnPilot device based on deployment requirement. This tab has multiple sections as follows:

- **System:** Provision to configure System UI parameter.
- **Radio:** Provision to configure Radio settings (2.4GHz/5GHz).

- **WLAN:** Provision to configure WLAN parameters as per the end user requirement and type of wireless station.
- **Network:** Provides information related to VLAN, Routes, Ethernet ports etc.
- **Services:** Provides information related to Network and Bonjour Gateway.

Operations

This section allows user to perform maintenance of device such as:

- **Firmware update:** Provision to upgrade cnPilot devices.
- **System:** Provides different methods of debugging field issues and recovering device.
- **Configuration:** Provision to modify configuration of device.

Troubleshoot

The section provides users to debug and troubleshoot remotely. This tab has multiple sections and are as follows:

- **WiFi Analyzer:** When this is initialized, device provides information related to air quality.
- **Spectrum Analyzer:** Provides real-time cumulative distribution format view of RF environment and it is generated by the AP across 2.4 and 5GHz frequency bands.
- **WiFi Perf Speed Test:** Provision for the user to check the speed of link connectivity, either wireless or wired.
- **Connectivity:** Provides different modes network reachability of cnPilot device.
- **Packet Capture:** Provides feasibility for the user to capture packets on operational interfaces.
- **Logs:** Feasibility to check logs of different modules of cnPilot devices which will help support and the customer to debug an issue.
- **Unconnected Clients:** This section displays clients that are not connected/denied connection.

Chapter 6: Configuration - System

This chapter describes the following topics:

- [System](#)
- [Management](#)
- [Time settings](#)
- [Event Logging](#)

System

Table 10 lists configurable parameters that are available under **Configuration > System** UI tab:

Table 13 Configuration: System parameters

Parameter	Description	Range	Default
Name	Hostname of the device. Configurable maximum length of hostname is 64 characters.	–	cnPilot Model Number-Last 3 Bytes of ESN
Location	The location where the device is placed. The maximum length of location is 64 characters.	–	–
Contact	Contact information for the device.	–	–
Country-Code	To be set by the administrator to the country-of-operation of the device. The allowed operating channels and the transmit power levels on those channels depends on the country of operation. Radios remain disabled unless this is set. The list of countries supported depends on the SKU of the device (FCC, ROW etc.).	–	–
Placement	<p>cnPilot device supports both Indoor and Outdoor deployments. Based on deployment user can configure it as follows:</p> <ul style="list-style-type: none"> • Indoor When selected, only Indoor channels for country code configured will be available and operational. • Outdoor When selected, only outdoor channels for country code configured will be available and operational. 	–	Indoor
PoE Output	Provision to power on standard 802.3af devices or Cambium devices.	–	Disabled

Parameter	Description	Range	Default
	<ul style="list-style-type: none"> Cambium-PoE 802.3af 		
LED	Select the LED checkbox for the device LEDs to be ON during operation.	–	Enabled
LLDP	Provision to advertise device capabilities and information in the L2 network.	–	Enabled

To configure the above parameters, navigate to the **Configuration > System** tab and provide the details as given below:

1. Enter the hostname of the device in the **Name** textbox.
2. Enter the location where this device is placed in the **Location** textbox.
3. Enter the contact details of the device is placed in the **Contact** textbox.
4. Select the appropriate country code for the regulatory configuration from the **Country-Code** drop-down list.
5. Select **Placement** checkbox parameter **Indoor** or **Outdoor** to configure the AP placement details.
6. Select **PoE Output** from the drop-down list.
7. Enable **LED** checkbox.
8. Enable **LLDP** checkbox.
9. Click **Save**.

Figure 17 Configuration: System page

System

Name Hostname of the device (max 64 characters)

Location Location where this device is placed (max 64 characters)

Contact Contact information for the device (max 64 characters)

Country-Code For appropriate regulatory configuration

Placement Indoor Outdoor Configure the AP placement details

PoE Output Enable Power-over-Ethernet to an auxiliary device connected to ETH2

LED Whether the device LEDs should be ON during operation

LLDP Whether the AP should transmit LLDP packets

Management

Table 11 lists configurable fields that are displayed in the **Configuration > System > Management** tab:

Table 14 Configuration: System > Management parameters

Parameter	Description	Range	Default
Admin Password	Password for authentication of UI and CLI sessions.	–	Admin
Autopilot	Provision to configure mode of cnPilot device when Autopilot is enabled in network: <ul style="list-style-type: none"> • Default Every cnPilot device by default operates as Auto-Pilot slave. • Master When selected, cnPilot device will take the role of controller. • Disabled When selected, auto-pilot mode is disabled on the device. 	–	Default
Telnet	Enables Telnet access to the device CLI.	–	Disabled
SSH	Enables SSH access to the device CLI.	–	Enabled
SSH Key	Provision to login to device using SSH Keys. User needs to add Public Key in this section. If configured, user has to login to AP using Private Keys. This is applicable for both CLI and GUI.	–	Disabled
HTTP	Enables HTTP access to the device UI.	–	Enabled
HTTP Port	Provision to configure HTTP port number to access device UI.	1-65535	80
HTTPS	Enables HTTPS access to the device UI.	–	Enabled
HTTPS Port	Provision to configure HTTPS port number to access device UI.	1-65535	443
RADIUS Mgmt Auth	User has provision to control login to AP using RADIUS authentication. If enabled, every credential that are provided by user undergo RADIUS authentication. If success, allowed to login to UI of AP. This is applicable for both CLI and GUI.	–	Disabled
RADIUS Server	Provision to configure RADIUS IPv4 server for Management Authentication.	–	–
RADIUS Secret	Provision to configure RADIUS shared secret for Management authentication.	–	–
cnMaestro			

Parameter	Description	Range	Default
Cambium Remote Mgmt.	Enables support for Cambium Remote Management of this device.	–	Enabled
Validate Server Certificate	This allows HTTPs connection between cnMaestro and cnPilot device.	–	Enabled
cnMaestro URL	Static provision to onboard devices either using IPv4/IPv6/URL.	–	–
Cambium ID	Cambium ID used for provisioning cnMaestro (Cambium Remote Management) of this device.	–	–
Onboarding Key	Password used for onboarding the device to cnMaestro.	–	–
SNMP			
Enabled	Provision to enable SNMPv2 or SNMPv3 support on device	–	–
SNMPv2c RO community	SNMP v2c read-only community string.	–	–
SNMPv2c RW community	SNMP v2c read-write community string.	–	–
Trap Receiver IP	Provision to configure SNMP trap receiver IPv4 server.	–	–
SNMPv3 Username	Enter username for SNMPv3.	–	–
SNMPv3 Password	Enter password for SNMPv3.	–	–
Authentication	choose Authentication type as MD5 or SHA.	–	MD5
Access	Choose Access type as RO or RW.	–	RO
Encryption	Choose ON or OFF.	–	ON

To configure the above parameters, navigate to the **Configuration > System** tab and provide the details as given below:

1. Enter the admin password of the device in the **Admin Password** textbox.
2. Select **Default, Master** or **Disabled** to enable/disable the **Autopilot** management of APs from the drop-down list.
3. Enable the **Telnet** checkbox to enable telnet access to the device CLI.
4. Enable the **SSH** checkbox to enable SSH access to the device CLI.
 - a. If certificate-based login is required, enter **SSH Key** in the textbox else disabled

5. Enable the **HTTP** checkbox to enable HTTP access to the device UI.
6. If custom port other than default is required, enter **HTTP port** number value for HTTP access in the textbox.
7. Enable the **HTTPS** checkbox to enable HTTPS access to the device UI.
8. If custom port other than default is required, enter **HTTP port** number value for HTTP access in the textbox.
9. If RADIUS based login is required, enable **RADIUS Mgmt Auth** checkbox and enter the details of RADIUS server as follows:
 - a. Enter **RADIUS Server** parameter in the textbox.
 - b. Enter **RADIUS Secret** parameter in the textbox.

To configure **cnMaestro**:

1. Enable **Remote Management** checkbox to support for Cambium Remote Management of this device.
2. Enable **Validate Server Certificate** checkbox to support HTTPS connection between cnMaestro and cnPilot.
3. Enter the URL for cnMaestro in the **cnMaestro URL** textbox.
4. Enter the Cambium ID of the user in the **Cambium ID** textbox.
5. Enter the onboarding Key in the **Onboarding Key** textbox.

To configure **SNMP**:

1. Select **Enable** checkbox to enable SNMP functionality.
2. Enter the SNMP v2c read-only community string in the **SNMPv2c RO community** textbox.
3. Enter the SNMP v2c read-write community string in the **SNMPv2c RW community** textbox.
4. Enter the **Trap Receiver IPv4** (Currently Cambium support SNMP only v1 and v2c Traps) in the textbox.
5. Enter the SNMP V3 username in the **SNMPv3 Username** textbox.
6. Enter the SNMP V3 password in the **SNMPv3 Password** textbox.
7. Select **MD5** or **SHA** from the **Authentication** drop-down list.
8. Select **RO** or **RW** from the **Access** drop-down list.
9. Select **ON** or **OFF** from the **Encryption** drop-down list.
10. Click **Save**.

Figure 18 Configuration: Management page

Management

Admin Password Configure password for authentication of GUI and CLI sessions

Autopilot Autopilot Management of APs

Telnet Enable Telnet access to the device CLI

SSH Enable SSH access to the device CLI

SSH Key Use SSH keys instead of password for authentication

HTTP Enable HTTP access to the device GUI

HTTP Port Port No for HTTP access to the device GUI(1-65535)

HTTPS Enable HTTPS access to the device GUI

HTTPS Port Port No for HTTPS access to the device GUI(1-65535)

Trap Receiver IP SNMP trap server ip address

SNMPv3 Username SNMPv3 user name (max 32 characters)

SNMPv3 Password SNMPv3 password (8 to 32 characters)

Authentication

Access

Encryption

Time settings

User can configure up to two NTP servers. These are used by the AP to set its internal clock to respective time zones configured on the device. While powering ON the AP, the clock will reset to default and resyncs the time as the cnPilot AP does not have battery backup. The servers can be specified as an IPv4 addresses or as a hostname (Eg: pool.ntp.org). If NTP is not configured on device, device synchronizes time with cnMaestro if onboarded.

Table 12 lists the fields that are displayed in the **Configuration > System > Time Settings** section:

Table 15 Configuration: System > Time Settings parameters

Parameter	Description	Range	Default
NTP Server 1	Name or IPv4 address of a Network Time Protocol server 1.	—	—
NTP Server 2	Name or IPv4 address of a Network Time Protocol server 2.	—	—

Parameter	Description	Range	Default
Time zone	<p>Time zone can be set according to the location where the AP is installed. By selecting the appropriate time zone from the drop-down list, ensures that the device clock is synced with the wall clock time.</p> <div style="display: flex; align-items: center;">  <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p>Note Accurate time on the AP is critical for features such as WLAN Scheduled Access, Syslogs etc.</p> </div> </div>	–	–

To configure the above parameters, navigate to the **Configuration > System** tab and provide the details as given below:

1. Enter the name or IPv4 address of the NTP server 1 in the **NTP Server 1** textbox.
2. Enter the name or IPv4 address of the NTP server 2 in the **NTP Server 2** textbox.
3. Select the time zone settings for the AP from the **Time Zone** drop-down list.
4. Click **Save**.

00:01:05 UTC

Event Logging

cnPilot devices supports multiple troubleshooting methods. Event Logging or Syslog is one of the standard troubleshooting processes. If you have Syslog server in your network, you can enable it on cnPilot device.

Table 13 lists the fields that are displayed in the **Configuration > System > Event Logging** section.

Table 16 Configuration: System > Event Logging parameters

Parameter	Description	Range	Default
Syslog Server 1	Hostname or IPv4/IPv6 address of the Syslog server and respective port number.	–	514
Syslog Server 2	Hostname or IPv4/IPv6 address of the Syslog server and respective port number.	–	514

Parameter	Description	Range	Default
Syslog Severity	Provision to configure severity of Logs that must be forwarded to the server. The Log levels supported are as per RFC.	–	Debug

To configure the above parameters, navigate to the **Configuration > System** tab and provide the details as given below:

1. Enter the FQDN or IPv4/IPv6 address of the **Syslog Server 1** along with customized port number in the textbox. If the port number is not entered, AP will take default value as **514**.
2. Enter the FQDN or IPv4/IPv6 address of the **Syslog Server 2** along with customized port number in the textbox. If the port number is not entered, AP will take default value as **514**.
3. Select the **Syslog Severity** from the drop-down list.
4. Click **Save**.

Syslog Server 1	<input type="text" value="10.110.211.97"/>	Port	<input type="text" value="514"/>	<i>Name or IPv4/IPv6 address of syslog server</i>
Syslog Server 2	<input type="text" value="10.110.219.10"/>	Port	<input type="text" value="1234"/>	
Syslog Severity	<input type="text" value="Debug (level 7) ▼"/> <i>Specify severity of events forwarded to Syslog servers</i>			

Maximum of two Syslog servers can be configured on cnPilot device. Events are sent to both configured Syslog servers if they are up and running.

Chapter 7: Configuration – Radio

This chapter describes the following topics:

- [Overview](#)
- [Configuring Radio parameters](#)

Overview

cnPilot devices support numerous configurable radio parameters to enhance the quality of service as per the deployment.

Configuring Radio parameters

All cnPilot devices support dual concurrent radio operations, i.e. both 2.4GHz and 5GHz can be turned on in parallel and hence each radio can be configured independently. **Radio 1** represents configuration of **2.4GHz Wi-Fi radio** and **Radio 2** represents configuration of **5GHz Wi-Fi radio** of cnPilot device. Information of each band radio configurable parameters are listed in [Table 14](#).

Table 17 Configure: Radio parameters

Parameter	Description	Range	Default
Radio			
Enable	Enables operation of radio.	-	Enabled
Channel	User can select the channel from the drop-down list. Channels in drop-down list is populated based on Country selected in Configuration > System UI .	<ul style="list-style-type: none"> • 2.4GHz: 1 - 14 • 5GHz: 36 - 173 	Auto
Channel Width	User can select operating width of the channel. <ul style="list-style-type: none"> • For 2.4GHz: Only 20MHz channel width is supported. • For 5GHz: 20MHz, 40MHz and 80MHz channel width is supported. 	-	<ul style="list-style-type: none"> • 20MHz for 2.4GHz • 80MHz for 5GHz
Transmit Power	User can configure transmit power of each radio based on coverage and SLA. Unit of transmit power is in dBm and its range is from 4 to 30. Maximum transmit power of cnPilot devices varies based on model number. More details of transmit power supported by each cnPilot device is available at https://www.cambiumnetworks.com/products/wifi/ . Transmit power drop-down box varies as per the country selected in Configuration > System UI . Default value is	<ul style="list-style-type: none"> • 2.4GHz: 4 - 30 • 5GHz: 4 - 30 	Auto

Parameter	Description	Range	Default
	AUTO , which means radio transmit power is configured to maximum as per the county configured selected in Configuration > System UI .		
Beacon Interval	User can configure time durations between two consecutive Beacon's. It is termed as Beacon interval.	50ms - 3400ms.	100
Minimum Unicast rate	Provision to adjust the coverage area of cnPilot device. Higher the rate selected, lesser the range. User can configure this value based on SLA in deployment. Drop-down list contains all values that are advertised by cnPilot device which includes legacy, HT and VHT rates.	Standard 802.11b and 802.11g data rates	1Mbps
Multicast data rate	Provision to configure multicast traffic rate. This is modified based on type of wireless station that will be connected to cnPilot device. Drop-down list contains highest-basic, lowest-basic and highest-supported.	–	<ul style="list-style-type: none"> • Highest Basic for 2.4GHz • Lowest Basic for 5GHz
Airtime Fairness	<p>Airtime Fairness is a solution on APs to increase the performance of 11n and 11ac clients (HT clients) in the presence of legacy 11abg clients. Legacy clients need more airtime to transmit/receive the data compared to HT clients (11n and 11ac clients). Because of this the overall throughput of the HT clients falls down. Enabling this feature improves the performance of HT clients by throttling the legacy clients.</p> <p>Compared to faster clients (802.11n/802.11ac), the slower clients (802.11a/802.11bg) consumes more airtime to transmit the same size data, in turn the throughput of faster clients fall as they get lesser chance to transmit (lesser airtime). Enabling this feature improves the performance of faster clients in a wireless network which is dominated by slower clients. This is achieved by controlling the airtime of slower clients.</p>	–	Disabled
Candidate Channels	<p>cnPilot provides user to configure selective channels based on their requirement. Options vary based on band of operation and is as follows:</p> <ul style="list-style-type: none"> • For 2.4GHz: <ul style="list-style-type: none"> ○ All ○ Specific • For 5GHz: <ul style="list-style-type: none"> ○ All ○ Specific ○ Prefer Non-DFS ○ Prefer DFS 	<ul style="list-style-type: none"> • 2.4GHz: 1 - 14 • 5GHz: 36 - 173 	All

Parameter	Description	Range	Default
Mode	All cnPilot devices are either 802.11ac Wave 1 or 802.11ac Wave 2 supported. There are few legacy clients which might not work as expected, hence this parameter can be tuned to backward compatibility based on wireless clients.	<ul style="list-style-type: none"> 2.4GHz: b, bg, n, gn 5GHz: a, ac, an, n, n-ac. 	<ul style="list-style-type: none"> 11n mixed mode for 2.4GHz 11ac for 5GHz
Short Guard Interval	Standard 802.11 parameter to increase the throughput of cnPilot device.	–	Enabled
Off Channel Scan (OCS)			
Enable	Provision to enable OCS on device to capture neighbour clients and APs.	–	–
Dwell-time	Configure the time period to spend scanning of Wi-Fi devices on a channel.	50-300	50ms
Auto-RF			
 <div style="background-color: #e1f5fe; padding: 5px;"> <p>Note</p> <ol style="list-style-type: none"> System release 4.0 Pre-releases of 4.0 </div>			
Enable	Provision to enable Auto-RF on device.	–	Disabled
Channel Selection Mode	Auto-RF supports two modes of channel selection: <ul style="list-style-type: none"> Interference based Channel Utilization based 	–	Interference
Channel Hold Time	Configure time period for the device to be on same channel selected by Auto-RF algorithm, irrespective of quality of channel after selection.	5-1800	120 Min
Channel Utilization Threshold	Configure the utilization thresholds to trigger channel selection by Auto-RF.	20-40	25%
Auto-RF			
 <div style="background-color: #e1f5fe; padding: 5px;"> <p>Note</p> <ol style="list-style-type: none"> System release 3.11.4 Post releases of 3.11.4 </div>			

Parameter	Description	Range	Default
Enable	Provision to enable Auto-RF on device.	–	Disabled
Packet Error Rate	Parameter to measure the unsuccessful packet transmissions by AP.	0-100 %	-
Channel Utilization	Parameter to measure the Channel efficiency.	0-100 %	-
Noise	Parameter to measure Noise Level on current operating channel of AP.	0 to -106 dBm	-
Interference Avoidance			
Packet Error Rate Threshold	This is a trigger mechanism to move out of current channel when configured threshold is met.	0-100	30%
Enhanced Roaming			
Enable	Provision to enable enhanced roaming on device.	–	Disabled
Roam SNR threshold	cnPilot device triggers de-authentication of wireless station, when the wireless station is seen at configured SNR or below.	1-100	15dB

To configure the above parameters, navigate to the **Configure > Radio** tab and select **Radio 1 (2.4GHz)** or **Radio 2 (5GHz)** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable the operations of this radio.
2. Select the primary operating channel from the **Channel** drop-down list.
3. Select the operating width (20 MHz, 40 MHz, or 80 MHz) of the channel from the **Channel Width** drop-down list for 5 GHz only. cnPilot do not support 40 MHz and 80 MHz in 2.4 GHz.
4. Select radio transmit power from the **Transmit Power** drop-down list.
5. Enter the beacon interval in the **Beacon Interval** textbox.
6. Select **Minimum Unicast Rate** from the drop-down list
7. Select **Highest Basic, Lowest Basic** or **Highest Supported** from the **Multicast data rate** drop-down list.
8. Enable **Airtime Fairness** checkbox.
9. Select the preferred **Candidate Channels** from the drop-down list.
10. Select **Mode** details from the drop-down list.
11. Enable **Short Guard Interval** checkbox.
12. Click **Save**.

To configure **Off Channel Scan**:

1. Select **Enable** checkbox to enable the operations of this radio.
2. Enter **Dwell-Time** in milliseconds in the textbox.

3. Click **Save**.

To configure **Auto-RF**:

1. Select **Enable** checkbox to enable the operations of this radio.
2. Select **Channel Selection Mode** from the drop-down list.
3. Enter **Channel Hold Time** in minutes in the textbox.
4. Enter **Channel Utilization Threshold** parameter in the textbox.
5. Click **Save**.

To configure **Interference Avoidance**:

1. Enter **Packet Error Rate Threshold** parameter in the textbox.
2. Click **Save**.

Chapter 8: Configuration - Wireless LAN

This chapter describes the following topics:

- [Overview](#)
- [Configuring WLAN parameters](#)

Overview

cnPilot devices support up-to 32 unique WLANs. Each of these WLANs can be configured as per the customer requirement and type of wireless station.

Configuring WLAN parameters

Configurable parameters under WLAN profile are categorized into two sections:

1. Basic
2. Advanced

Table 15 lists the configurable parameters for a WLAN profile which is common across bands.

Table 18 Configure: WLAN > Basic parameters

Parameters	Description	Range	Default
WLAN > Basic			
Enable	Option to enable a WLAN profile. Once enabled, a Beacon is broadcasted with SSID and respective configured parameters in a WLAN profile.	–	–
Mesh	<p>This parameter is required when a WDS connection is established with cnPilot devices. Four options are available under this parameter:</p> <ol style="list-style-type: none"> 1. Base A WLAN profile configured with mesh-base will operate like a normal AP. Its radio will beacon on startup so its SSID can be seen by radios configured as mesh-clients. 2. Client A WLAN profile configured with mesh-client will scan all available channels on startup, looking for a mesh-based AP to connect. 3. Recovery 	–	OFF (Access Profile Mode)

Parameters	Description	Range	Default
	<p>A WLAN profile configured as mesh-recovery will broadcast pre-configured SSID upon detection of mesh link failure after a successful connection. This needs to be exclusively configured on mesh-base device. Mesh-client will auto scan for mesh-recovery SSID upon failure of mesh link.</p> <p>4. Off Mesh support disable on WLAN profile.</p>		
SSID	SSID is the unique network name that wireless stations scans and associates.	–	–
VLAN	VLAN is configured to segregate wireless station traffic from AP traffic in the network. Wireless stations obtain IP address from the subnet configured in VLAN field of WLAN profile.	1-4094	1
Security	<p>This parameter determines key values that is encrypted based on selected algorithm. Following security methods are supported by cnPilot devices:</p> <ol style="list-style-type: none"> Open This method is preferred when Layer 2 authentication is built in the network. With this configured on cnPilot device, any wireless station will be able to connect. Osen This method is extensively used when Passpoint 2.0 is enabled on cnPilot devices. If Passpoint 2.0 is disabled, this security plays no role in wireless station association. WPA2-Pre-Shared Keys This mode is supported with AES and TKIP encryption. WPA-TKIP and WPA-AES can be enabled from the CLI with the “allow-tkip” CLI option. WPA2 Enterprise This security type uses 802.1x authentication to associate wireless stations. This is a centralized system of authentication method. WPA-TKIP and WPA-AES can be enabled from the CLI with the “allow-tkip” CLI option. 	–	Open
Passphrase	String that is a key value to generate keys based on security method configured.	–	12345678
Radios	<p>Each SSID can be configured to be transmitted as per the deployment requirement. For a regular access profile, options available to configure transmit mode of SSID:</p> <ul style="list-style-type: none"> 2.4GHz and 5GHz 	–	2.4GHz and 5GHz

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> 2.4GHz 5GHz <p>For mesh profile, options available are:</p> <ul style="list-style-type: none"> 2.4GHz 5GHz 		
VLAN Pooling	<p>This parameter is required when user requires to distribute clients across multiple subnets. Different modes of VLAN pooling is supported by cnPilot devices, based on infrastructure available at deployment site. Modes supported are as follows:</p> <ol style="list-style-type: none"> Disabled This feature is disabled for this WLAN. Radius Based User is expected to configure WPA2 Enterprise for this mode to support. During association phase, cnPilot obtains pool name from RADIUS transaction and based on present distribution of wireless station across VLANs, cnPilot selects appropriate VLAN and wireless station requests an IP address from the VLAN selected by cnPilot device. Static For this mode to support, user requires to configure VLAN Pool details available under Configure > Network > VLAN pool. During association phase, cnPilot obtains pool and based on present distribution of wireless station across VLANs, cnPilot selects appropriate VLAN and wireless station requests an IPv4/IPv6 address from the VLAN selected by cnPilot device. 	–	Disabled
Max Clients	This specifies the maximum number of wireless stations that can be associated to a WLAN profile. This varies based on cnPilot device model number. Refer Table 16 for more details.	1-512 (Refer Table 16)	127
Client Isolation	<p>This feature needs to be enabled when there is a need for prohibition of wireless station to station communication either over the network or on an AP. Three options are available to configure based on requirement:</p> <ol style="list-style-type: none"> Disable This option when selected disables client isolation feature. i.e. any wireless station can communicate to other wireless station. Local 	–	Disabled

Parameters	Description	Range	Default
	<p>This options when selected enables client isolation feature. This option prevents wireless station communications connected to same AP.</p> <p>3. Network Wide*</p> <p>This options when selected enables client isolation feature. It prevents wireless station communications connected to different AP deployed in same network.</p> <p>4. Network Wide Static*</p> <p>This option when configured enables client isolation feature across network. User has to configure gateway MAC to access device across subnets.</p> <p>*Note: When selected, user has provision to add MAC addresses to the Client isolation MAC List. Maximum 64 MAC addresses can be added.</p>		
cnMaestro Managed Roaming	By default, cnPilot devices support Layer 2 roaming. This option enables Layer 3 roaming. It is mandatory that cnPilot devices are connected to cnMaestro. Layer 3 roaming is valid only for Guest Access.	–	Disabled
Hide SSID	This is the basic security mode of a Wi-Fi device. This parameter when enabled, will not broadcast SSID.	–	Disabled
Session Timeout	This field is specific to non-guest wireless stations. When a wireless station connects, a session timer is triggered. Once session time expires, wireless station must undergo either re-authentication or re-association based on state of wireless station. By default, it is enabled.	60-604800	28800
Inactivity Timeout	Inactivity timer triggers whenever there is no communication between cnPilot device and wireless station associated to cnPilot device. Once the timer reaches the configured Inactivity timeout value, APs sends a de-authentication to that wireless station. By default, it is enabled.	60-28800	1800
Drop Multicast Traffic	When enabled, will drop all multicast flowing in or out of that WLAN.	–	Disabled

To configure the above parameters, navigate to the **Configure > WLAN > Basic** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable a particular WLAN.
2. Select the operating parameters from the **Mesh** drop-down list.
3. Enter the SSID name for this WLAN in the **SSID** textbox.
4. Enter the default VLAN assigned to the clients on this WLAN in the **VLAN** textbox.
5. Select **Security** type from the drop-down list.
6. Enter WPA2 Pre-shared security passphrase or key in the **Passphrase** textbox.

7. Select the radio type (2.4GHz, 5GHz) on which the WLAN should be supported from the **Radios** drop-down list.
8. Select the required **VLAN Pooling** parameters from the drop-down list.
9. Select **Max Clients** parameter value from the drop-down list.
10. Select the required **Client Isolation** parameter from the drop-down list.
11. Enable **cnMaestro Managed Roaming** checkbox for layer2/layer 3 roaming.
12. Enable **Hide SSID** checkbox.
13. Enter the session timeout value in the **Session Timeout** textbox.
14. Enter the inactivity timeout value in the **Inactivity timeout** textbox.
15. Select **Drop Multicast Traffic** checkbox to enable dropping multicast traffic.
16. Click **Save**.

Table 19 WLAN (Max Clients) parameters

Number of Clients	2.4GHz	5GHz	Concurrent
e600 and e700	512	512	512
e410/e410b/e430 and e510	256	256	256
E400 and E500/E501S/e502S	256	128	256
e425H and e505	100	100	100

QBSS	<p>When enabled, appends QBSS IE in Management frames. This IE provides information of channel usage by AP, so that smart wireless station can decide better AP for connectivity. Station count, Channel utilization and Available admission capacity are the information available in this IE.</p>	–	Disabled																														
DTIM interval	<p>This parameter plays a key role when power save supported mobile stations are part of infrastructure. This field when enabled controls the transmission of Broadcast and Multicast frames.</p>	1-255	1																														
Monitored Host																																	
Host	<p>This feature is required where there is interrupted backbone network. cnPilot device monitors the reachability of hostname/IP configured in this parameter and modifies the state of WLAN.</p>	–	Disabled																														
Interval	<p>The frequency of monitoring the network health based on the status of keep-alive mechanism w.r.t configured monitored host.</p>	60-3600 Sec	300																														
Attempts	<p>The number of packets in the keep-alive mechanism to determine the status.</p>	1-20	1																														

Parameters	Description	Range	Default
DNS Logging Host	This feature is required when an Administrator requires to monitor the websites accessed by wireless stations connected to WLAN profile.	–	Disabled
Connection Logging Host	When enabled provides information of all TCP connections accessed by a wireless station that is associated to WLAN.	–	Disabled
Band Steering	This feature when enabled, steers wireless stations to connect to 5GHz. There are three modes supported by cnPilot device. The mode can be selected based on either deployment or wireless station type. Below is the order of modes, which forces wireless station to connect to 5GHz band. <ul style="list-style-type: none"> • Low • Normal • Aggressive 	–	Disabled
Proxy ARP	Provision to avoid ARP flood in wireless network. When enabled, AP responds to ARP requests for the wireless stations connected to that AP. This is for IPv4 infrastructure.	–	Enabled
Proxy ND	Provision to avoid ARP flood in wireless network. When enabled, AP responds to ARP requests for the wireless stations connected to that AP. This is for IPv6 infrastructure.	–	Disabled
Unicast DHCP	Provision to transmit DHCP offer and ACK/NACK packets as Unicast packets to wireless stations.	–	Enabled
Insert DHCP Option 82	When enabled, DHCP packets generated from wireless stations that are associated to APs are appended with Option 82 parameters. Option 82 provides provision to append Circuit ID and Remote ID. Following parameters can be selected in both Circuit ID and Remote ID: <ul style="list-style-type: none"> • Hostname • AP MAC • BSSID • SSID • VLAN ID • Site ID • Custom • All 	–	Disabled

Parameters	Description	Range	Default
Tunnel Mode	This option is enabled when user traffic is tunneled to DMZ network either using L2TP or L2GRE.	–	Disabled
Fast-Roaming Protocol	<p>One of the important aspects to support voice applications on Wi-Fi network (apart from QoS) is how quickly a client can move its connection from one AP to another. This should be less than 150 msec to avoid any call drop. This is easily achievable when WPA2-PSK security mechanism is in use. However, in enterprise environments there is a need for more robust security (the one provided by WPA2-Enterprise). With WPA2-Enterprise, the client exchanges multiple frames with AAA server and hence depending on the location of AAA server the roaming-time will be above 700 msec.</p> <p>Select any one of the following:</p> <ol style="list-style-type: none"> OKC This roaming method is a proprietary solution to bring scalability to the roaming problem. This method avoids the need to authenticate with AAA server every time a client moves to new AP. 802.11r This is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with the new AP is done even before the client roams to the target AP, which is called Fast Transition (FT). Two modes of FT roaming are supported: <ul style="list-style-type: none"> Over-the-Air By default, this is enabled. Over-the-DS 	–	Disabled
Re-association Timeout	It's the number of seconds after which the reassociation attempt of a client to an AP should timeout. This is applicable only when FT roaming is enabled.	1-100	20
RRM (802.11k)	<p>AP sends the SSID name of the neighbor APs (SSID configured on multiple APs) to 11k clients.</p> <p>Following parameters needs to be enabled:</p> <ul style="list-style-type: none"> Enable OCS Enable RRM Support for WPA2 authentication method 	–	Disabled
PMF (802.11w)	802.11w, also termed as Protected Management Frames (PMF) Service, defines encryption for management frames. Unencrypted management frames makes wireless connection vulnerable to DoS attacks as well as they cannot protect important information exchanged using management frames from eavesdroppers.	<ul style="list-style-type: none"> Optional Mandatory Disabled 	–

Parameters	Description	Range	Default
SA Query Retry Time	The legitimate 802.11w client must respond with a Security Association (SA) Query Response frame within a pre-defined amount of time (milliseconds) called the SA Query Retry time.	100-500	100ms
Association Comeback Time	This value is included in the Association Response as an Association Comeback Time information element. AP will deny association for the configured interval.	1-20	1 Sec

To configure the above parameters, navigate to the **Configure > WLAN > Basic** tab and provide the details as given below:

1. Select the **UAPSD** checkbox to enable UAPSD.
2. Select the **QBSS** checkbox to enable QBSS.
3. Enter the value in the **DTIM interval** textbox to configure DTIM interval.
4. Enter IP address or Hostname in **Host** textbox.
5. Enter **Interval** time duration in the textbox.
6. Select number of attempts to check the reachability of monitored host in the **Attempts** drop-down list.
7. Enter an IP Address or Hostname in the **Monitored Host** textbox.
8. Enter the FQDN or IP address of the Server where all the client DNS requests will be logged in the **DNS Logging Host** server along with customized port number in the textbox. If the port number is not entered, AP will take default value as 514.
9. Enter the FQDN or IP address of the Server where all wireless client connectivity events/logs will be displayed in the configured **Connection Logging Host** server along with customized port number in the textbox. If the port number is not entered, AP will take default value as 514.
10. Select **Band Steering** parameter for 5GHz band from the drop-down list.
11. Enable **Proxy ARP** checkbox to avoid ARP flood in wireless network.
12. Enable **Proxy ND** checkbox to avoid ARP flood in wireless network.
13. Enable **Unicast DHCP** checkbox to Convert DHCP-OFFER and DHCP-ACK to unicast before forwarding to clients.
14. Enable **Insert DHCP Option 82** checkbox.
15. Select **Option 82 Circuit ID** to enable DHCP Option-82 from the drop-down list.
16. Select **Option 82 Remote ID** to choose the MAC address of the AP from the drop-down list.
17. Select **Tunnel Mode** checkbox to enable tunnelling of WLAN traffic over configured tunnel.
18. Enable the required **OKC or 802.11r** configure roaming protocol in the **Fast-Roaming Protocol** checkbox.
19. Enable **RRM (802.11k)** checkbox.
20. Select **PMF (802.11w)** parameter from the drop-down list.
 - a. Enter **SQ Query Retry Time** in the textbox.
 - b. Enter **Association Comeback Time** in the textbox.
21. Click **Save**.

Figure 24 Configure: WLAN > Advanced parameter

Advanced

UAPSD *Enable UAPSD*

QBSS *Enable QBSS load element*

DTIM interval *Number of beacons (1-255)*

Monitored Host

Host *IP Address or Hostname that should be reachable for this WLAN to be active*

Interval *Duration in seconds (60-3600)*

Attempts *Number of attempts to check the reachability of monitored host (1-20)*

DNS Logging Host **Port** *Syslog server where all client DNS requests will be logged*

Connection Logging Host **Port** *Syslog server where all client connection requests will be logged*

Band Steering *Steer dual-band capable clients towards 5GHz radio*

Proxy ARP *Respond to ARP requests automatically on behalf of clients*

Proxy ND *Respond to ipv6 ND requests automatically on behalf of clients*

Unicast DHCP *Convert DHCP-OFFER and DHCP-ACK to unicast before forwarding to clients*

Insert DHCP Option 82 *Enable DHCP Option 82*

Tunnel Mode *Enable tunnelling of WLAN traffic over configured tunnel*

Fast-Roaming Protocol OKC 802.11r *Configure roaming protocol*

Over-the-DS

Re-association Timeout *Number of seconds (1-100)*

RRM (802.11k) *Enable Radio Resource Measurements (802.11k)*

PMF (802.11w)

SA Query Retry Time *Number of msec (100-500)*

Association Comeback Time *Number of seconds (1-20)*

Table 21 Configure: WLAN > Radius Server parameters

Parameters	Description	Range	Default
Authentication Server	Provision to configure RADIUS Authentication server details such as Hostname/IPv4/IPv6, Shared Secret, Port Number and Realm. Maximum of three RADIUS server can be configured.	–	Disabled
Accounting Server	Provision to configure Accounting server details such as Hostname/IPv4/IPv6, Shared Secret, Port Number. Maximum of three RADIUS server can be configured.	–	Disabled
Timeout	Wait time period for response from AAA server.	1-30	3
Attempts	Parameter to configure number of attempts that a device should send AAA request to server if no response is received within configured timeout period.	1-3	1
Accounting Mode	This field is enabled based on customer requirement. Accounting packet is transmitted based on mode selected. <ol style="list-style-type: none"> Start-Stop Accounting packets are transmitted by AP to AAA server when a wireless station is connected and then disconnects. Start-Interim-Stop Accounting packets are transmitted by AP to AAA server when a wireless station connects and then at regular intervals of configured Interim Update Interval and then when it disconnects. None Accounting mode will be disable. 	–	Disabled
Accounting Packet	When enabled, Accounting-On is sent for every client when connected.	–	Disabled
Sync Accounting Records	When enabled, will share the accounting records when wireless stations move across different AP that are Layer 2 connected.	–	Disabled
Server Pool Mode	User can configure multiple Authorization and Accounting servers. Based on number of wireless stations, user can choose either Failover or Load Balance mode. <ol style="list-style-type: none"> Load Balance AP communicates with multiple servers and ensures that authorization and accounting are equally shared across configured servers. Failover 	–	Load Balance

Parameters	Description	Range	Default
	AP selects the RADIUS server which is up and running based on the order of configuration.		
NAS Identifier	This is configurable parameter and is appended in RADIUS request packet. <ol style="list-style-type: none"> 1. AP-ETH0-MAC: NAS identifier attribute will be ETH0 MAC address 2. WLAN-BSSID: NAS identifier attribute will be WLAN-BSSID 3. Custom: Any custom value 	–	Hostname/ System Name
NAS IP	NAS-IP attribute for use in RADIUS request packets. Default is set to device IP and option to configure custom IP address with the option Custom .	-	AP-IP
Interim Update Interval	This field is used when RADIUS accounting is enabled, and mode selected as Start-Interim-Stop.	10-65535	1800
Dynamic Authorization	This option is required, where there is a CoA requests from AAA/RADIUS server.	–	Disabled
Dynamic VLAN	When enabled, AP honors the VLAN information provided in RADIUS transaction. Wireless station requests IP address from the same VLAN learnt through RADIUS.	–	Enabled
Proxy through cnMaestro	This option is enabled, whenever cnMaestro is required to act as proxy server to RADIUS authentication requests coming from cnPilot devices that are connected to cnMaestro.	–	Disabled
Called Station ID	Following information can be communicated to RADIUS server: <ul style="list-style-type: none"> • AP-MAC • AP-MAC: SITE-NAME • AP-MAC: SSID • AP-MAC: SSID-SITE-NAME • AP-NAME • AP-NAME: SITE-NAME • AP-NAME: SSID • SITE-NAME • SSID • CUSTOM 		AP-MAC: SSID

To configure the above parameters, navigate to the **Configure > WLAN** tab and select **Radius Server** tab and provide the details as given below:

1. Enter the RADIUS Authentication server details such as Hostname/Shared Secret/Port Number/Realm in the **Authentication Server 1** textbox.
2. Enter the time in seconds of each request attempt in **Timeout** textbox.
3. Enter the number of attempts before a request is given up in the **Attempts** textbox.
4. Select the configuring **Accounting Mode** from the drop-down list.
5. Enable **Accounting Packet** checkbox.
6. Enable **Sync Accounting Records** checkbox to enable sync accounting records configuration.
7. Enable **Load Balance/Failover** in the **Server Pool Mode** checkbox.
8. Enter the **NAS Identifier** parameter in the textbox.
9. Enter the **Interim Update Interval** parameter value in the textbox.
10. Enable **Dynamic Authorization** checkbox to configure dynamic authorization for wireless clients.
11. Enable **Dynamic VLAN** checkbox.
12. Enable **Proxy through cnMaestro** checkbox.
13. Select **Called Station ID** from the drop-down list.
14. Click **Save**.

Table 22 NAS IP with AP dual stack

IPv6 preference	AP Address Mode	NAS ID
Yes	DUAL STACK	IPv6
No	DUAL STACK	IPv4
Yes	IPv6 only	IPv6
No	IPv6 only	IPv6
Yes	IPv4 only	IPv4
No	IPv4 only	IPv4

Figure 25 Configure: WLAN > Radius Server parameter

The screenshot displays the 'Radius Server' configuration interface. It features several sections:

- Authentication Servers:** Three rows for configuring Host, Secret, Port, and Realm.
- Accounting Servers:** Three rows for configuring Host, Secret, and Port.
- Global Settings:** Includes Timeout (3s), Attempts (1), Accounting Mode (None), Accounting Packet (disabled), Server Pool Mode (Load Balance selected), NAS Identifier (AP-HOSTNAME), NAS IP (AP-IP), Interim Update Interval (1800s), Dynamic Authorization (checked), Dynamic VLAN (checked), Proxy through cnMaestro (unchecked), and Called Station ID (AP-MAC:SSID).

 The interface includes 'Save' and 'Cancel' buttons at the bottom center.

Table 23 Configure: WLAN > Guest Access > Internal Access Point parameters

Parameters	Description	Range	Default
WLAN > Guest Access > Internal Access Point			
Enable	Enables the Guest Access feature.	–	Disabled
Access Policy	There are four types of access types provided for the user: 1. Clickthrough This mode allows the users to get access data without any authentication mechanism. User can	–	Clickthrough

Parameters	Description	Range	Default
	<p>access internet as soon as he is connected and accepts Terms and Conditions.</p> <p>2. RADIUS</p> <p>This mode when selected, user has to provide username and password, which is then redirected to RADIUS server for authentication. If successful, user is provided with data access.</p> <p>3. LDAP</p> <p>This mode when selected, user has to provide username and password, which is then redirected to LDAP server for authentication. If successful, user is provided with data access.</p> <p>4. Local Guest Account</p> <p>User must configure username and password on device, which has to be provided in the redirection page for successful authentication and data access.</p>		
Redirect Mode	<p>This option helps the user to configure the HTTP or HTTPS mode of redirection URL.</p> <p>1. HTTP</p> <p>AP sends a HTTP POSTURL to the associated client, which will be http://<Pre-defined-URL>.</p> <p>2. HTTPS</p> <p>AP sends HTTPS POSTURL to the successful associated client, which will be https://<Pre-defined-URL>.</p>	–	HTTP
Redirect Hostname	<p>User can configure a friendly hostname, which is added in DNS server and is resolvable to cnPilot IP address. This parameter once configured will be replaced with IP address in the redirection URL provided to wireless stations.</p>	–	–
Title	<p>User can configure a Title to the splash page. Configured text in this parameter will be displayed in the redirection page. This text is usually Bold.</p>	Up to 255 characters	Welcome To Cambium Powered Hotspot
Contents	<p>User can configure the contents of Splash page using this field. Displays the text configured under the Title section of redirection page.</p>	Up to 255 characters	Please enter username and password to get Web Access
Terms	<p>Splash page displays the text configured when user accepts Terms and Agreement.</p>	Up to 255 characters	–

Parameters	Description	Range	Default
Logo	Displays the logo image updated in URL <a href="http(s)://<ipaddress>/logo.png">http(s)://<ipaddress>/logo.png . Either PNG or JPEG format of logo are supported.	–	–
Background Image	Displays the background image updated in URL <a href="http(s)://<ipaddress>/backgroundimage.png">http(s)://<ipaddress>/backgroundimage.png . Either PNG or JPEG format of logo are supported.	–	–
Success Action	Provision to configure redirection URL after successful login to captive portal services. User can configure three modes of redirection URL: <ol style="list-style-type: none"> Internal Logout Page After successful login, wireless client is redirected to logout page hosted on AP. Redirect user to External URL Here users will be redirected to URL which is configured on device in Redirection URL configurable parameter. Redirect user to Original URL Here users will be redirected to URL that is accessed by user before successful captive portal authentication. 	–	Internal Logout page
Redirect user to External URL	Provision to configure re-direction URL after successful login and an additional information of AP and wireless station information can be appended in the URL. <ul style="list-style-type: none"> Prefix Query Strings in Redirect URL This option is selected by default. Following information is appended in the redirection URL: <ul style="list-style-type: none"> ○ SSID ○ AP MAC ○ NAS ID ○ AP IP ○ Client MAC ○ Redirection URL ○ User can provide either HTTP or HTTPS URL 	–	–
Redirection user to Original URL	Users will be redirected to URL that is accessed by user before successful captive portal authentication. There is additional parameter Prefix Query Strings in Redirection URL that is enabled by default and details given below: <ul style="list-style-type: none"> Prefix Query Strings in Redirect URL This option is selected by default. Following information is appended in the redirection URL: 	–	–

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> ○ SSID ○ AP MAC ○ NAS ID ○ AP IP ○ Client MAC 		
Success message	Provision to configure text to display upon successful Guest Access authentication. This is applicable only when Success Action mode is Internal Logout Page.	–	–
Redirect	<ul style="list-style-type: none"> • If enabled, only HTTP URLs will be redirected to Guest Access login page. • If disabled, both HTTP and HTTPS URLs will be redirected to Guest Access login page. 	–	Enabled
Redirect User Page	IPv4/IPv6 address configured in this field is used as logout URL for Guest Access sessions. IPv4/IPv6 address configured should be not reachable to internet.	–	1.1.1.1
Proxy Redirection Port	Proxy port can be configured with which proxy server is enabled. This allows URL's accessed with proxy port to be redirected to login page.	1 - 65535	–
Session Timeout	This is the duration of time, client will be allowed to access internet if quota persists, after which AP sends de-authentication. Wireless station has to undergo Guest Access authentication after session timeout.	60 - 2592000	28800
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but no data traffic. AP starts timer when there is no data received from a wireless station and disconnects when timer reaches 0.	60 - 2592000	1800
MAC Authentication Fallback	It's a mechanism in which wireless stations will be redirected to Guest Access login page after any supported type of MAC address authentication fails.	–	Disabled
Extend Interface	Provision to support Guest Access on Ethernet interface.	–	Disabled
Whitelist	Provision to configure either IPv4/IPv6 or URLs to bypass traffic, therefor user can access those IPs or URLs without Guest Access authentication.	–	–
Captive Portal bypass User Agent	Provision to limit the auto-popup to a certain browser as configured based on User-agent of browsers.	–	–

To configure the above parameters, navigate to the **Configure > WLAN > Guest Access** tab and provide the details as given below:

1. Select **Enable** checkbox to enable the Guest Access feature.
2. Enable **Internal Access Point** checkbox.
3. Enable the required access types from the **Access Policy** checkbox.
4. Enable **HTTP** or **HTTPS** from the **Redirect Mode** checkbox.
5. Enter **Redirect Hostname** in the textbox.
6. Enter the title to appear in the splash page in the **Title** textbox.
7. Enter the content to appear in the splash page in the **Contents** textbox.
8. Enter the terms and conditions to appear in the splash page in the **Terms** textbox.
9. Enter the logo to be displayed in the **Logo** textbox.
10. Select the **Background Image** to be displayed on the splash page in the textbox.
11. Enable configured modes of redirection URL in **Success Action** checkbox.
12. Enter **Success message** to appear in the textbox.
13. Enable **Redirect** checkbox for HTTP packets.
14. Enter configuring IP address in the **Redirect User Page** textbox.
15. Enter Port number in the **Proxy Redirection Port** textbox.
16. Enter the session timeout in seconds in the **Session Timeout** textbox.
17. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
18. Enable **MAC Authentication Fallback** checkbox if guest-access is used only as fallback for clients failing MAC-authentication.
19. Enter the name of the interface that is extended for guest access in the **Extend Interface** textbox.
20. Click **Save**.

To configure **Whitelist** parameter:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

To configure the **Captive Portal bypass User Agent** parameter:

1. Select **Index** parameter value from the drop-down list.
2. Enter **User Agent String** parameter in the textbox.
3. Select **Status Code** from the drop-down list.
4. Enter **HTML Response** in the textbox.
5. Click **Save**.

Table 24 Configure: WLAN > Guest Access > External Hotspot parameters

Parameters	Description	Range	Default
WLAN > Guest Access > External Hotspot			
Access Policy	<p>There are four types of access types provided for the end user:</p> <ol style="list-style-type: none"> Clickthrough This mode allows users to get access data without any authentication mechanism. User can access internet as soon as he is connected and accepts Terms and Conditions. RADIUS User has to provide username and password, which is then redirected to RADIUS server for authentication. If successful, user is provided with data access. LDAP User must provide username and password, which is then redirected to LDAP server for authentication. If successful, user is provided with data access. Local Guest Account User has to configure username and password on device, which has to be provided in the redirection page for successful authentication and data access. 	–	Clickthrough
LDAP Server baseDN	Provision to configure the point from where the server will search for users.	–	–
LDAP Server adminDN	Provision to configure the Admin Domain which binds with LDAP server for successful search of LDAP/AD server.	–	–
LDAP Server Admin Password	Provision to configure Admin password of LDAP/AD server to search all organizational unit defined in a Domain component.	–	–
Redirect Mode	<p>Provision to configure the HTTP or HTTPS mode of redirection URL.</p> <ol style="list-style-type: none"> HTTP AP sends a HTTP POSTURL to the associated client, which will be <a href="http://<Pre-defined-URL>">http://<Pre-defined-URL>. HTTPS AP sends HTTPS POSTURL to the successful associated client, which will be <a href="https://<Pre-defined-URL>">https://<Pre-defined-URL>. 	–	HTTP

Parameters	Description	Range	Default
Redirect Hostname	User can configure a friendly hostname, which is added in DNS server and is resolvable to cnPilot IP address. This parameter once configured will be replaced with IP address in the redirection URL provided to wireless stations.	–	–
WISPr Clients External Server Login	Provision to enable re-direction of guest access portal URL obtained through WISPr.	–	Disabled
External Page URL	User can configure landing/login page which is posted to wireless stations that are not Guest Access authenticated.	–	–
External Portal Post Through cnMaestro	This is required when HTTPS is only supported by external guest access portal. This option when enabled minimizes certification. Certificate is required to install only in cnMaestro On-Premises.	–	Disabled
External Portal Type	Two modes of portal types are supported by cnPilot products. 1. Standard This mode is selected, for all third-party vendors whose Guest Access services is certified and integrated with cnPilot products. 2. XWF This mode is selected for Facebook Express Wi-Fi deployment.	–	Standard
XWF Version	1. XWF-v1 is also called as XWF-Lite 2. XWF-v2 is also called as XWF-Full 3. XWF-v3	–	1
XWF Key	This is applicable when XWF portal mode is selected irrespective of XWF version.	–	–
XWF Access Token	XWF Access token in URL encoded format.	–	–
XWF SSE Server Timeout	This is applicable when XWF portal mode is selected. Provision to configure XWF SSE Server Timeout.	5-1800	60
Success Action	Provision to configure redirection URL after successful login to captive portal services. User can configure three modes of redirection URL: 1. Internal Logout Page After successful login, Wireless client is redirected to logout page hosted on AP.	–	Internal Logout Page

Parameters	Description	Range	Default
	<p>2. Redirect user to External URL</p> <p>Here users will be redirected to URL which is configured on device in Redirection URL configurable parameter.</p> <p>3. Redirect user to Original URL</p> <p>Here users will be redirected to URL that is accessed by user before successful captive portal authentication.</p>		
Redirect user to External URL	<p>Provision to configure re-direction URL after successful login and an additional information of AP and wireless station information can be appended in the URL.</p> <ul style="list-style-type: none"> Prefix Query Strings in Redirect URL This option is selected by default. Following information is appended in the redirection URL: <ul style="list-style-type: none"> SSID AP MAC NAS ID AP IP Client MAC Redirection URL User can provide either HTTP or HTTPS URL. 	–	–
Redirection user to Original URL	<p>Users will be redirected to URL that is accessed by user before successful captive portal authentication. There is additional parameter Prefix Query Strings in Redirection URL that is enabled by default and details given below:</p> <ul style="list-style-type: none"> Prefix Query Strings in Redirect URL This option is selected by default. Following information is appended in the redirection URL: <ul style="list-style-type: none"> SSID AP MAC NAS ID AP IP Client MAC 	–	–
Success message	<p>Provision to configure text to display upon successful Guest Access authentication. This is applicable only when Success Action mode is Internal Logout Page.</p>	–	–

Parameters	Description	Range	Default
Redirection URL Query String	<p>Following information is appended in the redirection URL, if “Prefix Query Strings in Redirect URL” is enabled.</p> <ul style="list-style-type: none"> Client IP RSSI AP Location 	–	Disabled
Redirect	<ul style="list-style-type: none"> If enabled, only HTTP URLs will be redirected to Guest Access login page. If disabled, both HTTP and HTTPs URLs will be redirected to Guest Access login page. 	–	Enabled
Redirect User Page	IP address configured in this field is used as logout/disconnect/redirect to captive portal URL for Guest Access sessions. IP address configured should not be reachable to internet.	–	1.1.1.1
Proxy Redirection Port	Proxy port can be configured with which proxy server is enabled. This allows URL’s accessed with proxy port to be redirected to login page.	1 - 65535	–
Session Timeout	This is the duration of time, client will be allowed to access internet if quota persists, after which AP sends de-authentication. Wireless station has to undergo Guest Access authentication after session timeout.	60 - 2592000	28800
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but no data traffic. AP starts timer when there is no data received from a wireless station and disconnects when timer reaches 0.	60 - 2592000	1800
MAC Authentication Fallback	It’s a mechanism in which wireless stations will be redirected to Guest Access login page after any supported type of MAC address authentication failures.	–	Disabled
Extend Interface	Provision to support Guest Access on Ethernet interface.	–	Disabled
Traffic Class 1	This is exclusively applicable for XWF portal type. This traffic class includes IP and URLs related to XWF for successful re-direction, login and payments.	–	–
Traffic Class 2	This is exclusively applicable for XWF portal type. This traffic class includes whitelist IP/URLs that can be accessed without Guest Access authentication.	–	–
Internet	This is exclusively applicable for XWF portal type. This traffic class includes whitelist IP/URLs that can be accessed after successful Guest Access authentication.	–	–

Parameters	Description	Range	Default
Whitelist	Provision to configure either IPs or URLs to bypass traffic, such that user can access those IPs or URLs without Guest Access authentication. This parameter is valid for standard portal type.	–	–
Captive Portal bypass User Agent	Provision to limit the auto-popup to a certain browser as configured based on User-agent of browsers. This is valid for standard portal type.	–	–

To configure the above parameters, navigate to the **Configure > WLAN > Guest Access** tab and provide the details as given below:

1. Enable the required access types from the **Access Policy** checkbox.
2. Enable **HTTP** or **HTTPS** from the **Redirect Mode** checkbox.
3. Enter **Redirect Hostname** in the textbox.
4. Enable **WISPr Clients External Server Login** checkbox.
5. Enter **External Page URL** in the textbox.
6. Enable **External Portal Post Through cnMaestro** checkbox.
7. Select **External Portal Type** from the drop-down list.
8. Enable configured modes of redirection URL in **Success Action** checkbox.
9. Enter **Success message** to appear in the textbox.
10. Enable the required **Redirection URL Query String** checkbox.
11. Enable **Redirect** checkbox for HTTP packets.
12. Enter configuring IP address in the **Redirect User Page** textbox.
13. Enter Port number in the **Proxy Redirection Port** textbox.
14. Enter the session timeout in seconds in the **Session Timeout** textbox.
15. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
16. Select the **MAC Authentication Fallback** checkbox if guest-access is used only as fallback for clients failing MAC-authentication.
17. Enter the name of the interface that is extended for guest access in the **Extend Interface** textbox.
18. Click **Save**.
19. Select **Traffic Class 1** and **Traffic Class 2** tabs and enter the following:
 1. Enter **Name** in the textbox.
 2. Enter **Policy** in the textbox.
 3. Click **Save**.
20. Select **Internet** tab and enter **Name** in the textbox.
 1. Click **Save**.

To configure **Whitelist**:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

To configure **Captive Portal bypass User Agent**:

1. Select **Index** parameter value from the drop-down list.
2. Enter **User Agent String** parameter in the textbox.
3. Select **Status Code** from the drop-down list.
4. Enter **HTML Response** in the textbox.
5. Click **Save**.

Table 25 Configure: WLAN > Guest Access > cnMaestro parameters

Parameters	Description	Range	Default
WLAN > Guest Access > cnMaestro			
Guest Portal Name	Provision to configure the name of the Guest Access profile which is hosted on CnMaestro.	–	–
Redirect	<ul style="list-style-type: none"> If enabled, only HTTP URLs will be redirected to Guest Access login page. If disabled, both HTTP and HTTPs URLs will be redirected to Guest Access login page. 	–	Enabled
Redirect User Page	IP address configured in this field is used as logout URL for Guest Access sessions. IP address configured should be not reachable to internet.	–	1.1.1.1
Proxy Redirection Port	Proxy port can be configured with which proxy server is enabled. This allows URL's accessed with proxy port to be redirected to login page.	1 - 65535	–
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but no data traffic. AP starts timer when there is no data received from a wireless station and disconnects when timer reaches 0.	60 - 2592000	1800
MAC Authentication Fallback	It's a mechanism in which wireless stations will be redirected to Guest Access login page after any supported type of MAC address authentication fails.	–	Disabled
Extend Interface	Provision to support Guest Access on Ethernet interface.	–	Disabled
Whitelist	Provision to configure either IPs or URLs to bypass traffic, such that user can access those IPs or URLs without Guest Access authentication.	–	–
Captive Portal bypass User Agent	Provision to limit the auto-popup to a certain browser as configured based on User-agent of browsers.	–	–

To configure the above parameters, navigate to the **Configure > WLAN > cnMaestro** tab and provide the details as given below:

1. Enter **Guest Portal Name** which is hosted on cnMaestro in the textbox.
2. Enable **Redirect** checkbox for HTTP packets.
3. Enter configuring IP address in the **Redirect User Page** textbox.
4. Enter Port number in the **Proxy Redirection Port** textbox.
5. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
6. Select the **MAC Authentication Fallback** checkbox if guest-access is used only as fallback for clients failing MAC-authentication.

7. Enter the name of the interface that is extended for guest access in the **Extend Interface** textbox.
8. Click **Save**.

To configure the Whitelist parameter:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address or Domain Name** textbox.
2. Click **Save**.

To configure the **Captive Portal bypass User Agent** parameter:

1. Select **Index** parameter value from the drop-down list.
2. Enter **User Agent String** parameter in the textbox.
3. Select **Status Code** from the drop-down list.
4. Enter **HTML Response** in the textbox.
5. Click **Save**.

Figure 29 Configure: WLAN > Guest Access > cnMaestro parameter

The screenshot displays the configuration page for 'Guest Access' under 'cnMaestro'. The 'Basic' tab is active. The configuration includes:

- Enable:** Checked.
- Portal Mode:** Radio buttons for 'Internal Access Point', 'External Hotspot', and 'cnMaestro' (selected).
- Guest Portal Name:** Textbox containing 'SIT_GuestAccess'.
- Redirect:** Checked, with sub-option 'HTTP-only'.
- Redirect User Page:** Textbox containing '1.1.1.1'.
- Proxy Redirection Port:** Empty textbox.
- Inactivity Timeout:** Textbox containing '1800'.
- MAC Authentication Fallback:** Unchecked checkbox.
- Extend Interface:** Empty textbox.

An 'Add Whitelist' modal is open, showing a table with the following structure:

IP Address Domain Name	Action
No white list available	

The modal also includes a 'Save' button and a pagination control at the bottom showing '1 / 1' items and '10 items per page'.

Table 26 Configure: WLAN > Usage Limits parameters

Parameters	Description	Range	Default
Rate Limit per Client	Provision to limit throughput per client. Default allowed throughput per client is unlimited. i.e., maximum allowed by 802.11 protocols. The traffic from/to each client on a SSID can be rate-limited in either direction by configuring Client rate limit available in usage-limits inside the WLAN Configuration. This is useful in deployments like public hotspots where the backhaul is limited and the network administrator would like to ensure that one client does not monopolize all available bandwidth.	–	0 [Unlimited]
Rate Limit per WLAN	Provision to limit throughout across WLAN irrespective of number of associated wireless stations to WLAN. All upstream/downstream traffic on an SSID (aggregated across all wireless clients) can be rate-limited in either direction by configuring usage-limits inside the WLAN Configuration section of the GUI. This is useful in cases where multiple SSIDs are being used and say one is for corporate use, and another for guests. The network administrator can ensure that the guest VLAN traffic is always throttled, so it will not affect the corporate WLAN.	–	0 [Unlimited]

To configure the above parameters, navigate to the **Configure > WLAN > Usage Limits** tab and provide the details as given below:

1. Enter **Upstream** and **Downstream** parameters in the **Rate Limit per Client** textbox.
2. Enter **Upstream** and **Downstream** parameters in the **Rate Limit per WLAN** textbox.
3. Click **Save**.

Figure 30 Configure: WLAN > Usage Limits parameters

The screenshot shows the configuration interface for WLAN Usage Limits. At the top, there are tabs for 'Basic', 'Radius Server', 'Guest Access', 'Usage Limits' (which is active), 'Scheduled Access', 'Access', and 'Passpoint'. Below the tabs, there are two main configuration sections:

- Rate Limit per Client:** This section contains two input fields. The 'Upstream' field is labeled 'Upstream:' and has a value of '0' with 'Kbps' below it. The 'Downstream' field is labeled 'Downstream:' and also has a value of '0' with 'Kbps' below it.
- Rate Limit per WLAN:** This section also contains two input fields. The 'Upstream' field is labeled 'Upstream:' and has a value of '0' with 'Kbps' below it. The 'Downstream' field is labeled 'Downstream:' and has a value of '0' with 'Kbps' below it.

At the bottom right of the configuration area, there are two buttons: 'Save' and 'Cancel'.

Table 27 Configure: WLAN > Scheduled Access parameters

Parameters	Description	Range	Default
Scheduled Access	Provision to configure the availability of Wi-Fi services for a selected time duration. cnPilot has capability of configuring the availability of Wi-Fi services on all days or on specific day (s) of a week. Time format is in Hours.	00:00 Hrs. - 23:59 Hrs.	Disabled

To configure the above parameter, navigate to the **Configure > WLAN > Scheduled Access** tab and provide the details as given below:

1. Enter the start and end time to enable the Wi-Fi access in the respective textboxes.
2. Click **Save**.

Figure 31 Configure: WLAN > Scheduled Access parameters

Table 28 Configure: WLAN > Access parameters

Parameters	Description	Range	Default
ACL			
Precedence	Provision to configure index of ACL rule. Packets are validated and processed based on precedence value configured.	1-256	1
Policy	Provision to configure whether to allow, deny or route traffic.	Allow/deny/Route	Deny
Direction	Provision to apply the ACLs rules configured either in any direction or specific direction.	–	–
Type	cnPilot devices support three layers of ACLs. A rule can be configured as below:	–	IP

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> • MAC • IP This type is for IPv4 based IP ACL. • IP6 This type is for IPv6 based IP ACL. • Proto This type is for protocol supported in IPv4. • Proto6 This type is for protocol supported in IPv6. 		
Source IP/Mask	This option is available when ACL type is configured to an IPv4/IPv6 address. This field helps user to configure if rule needs to be applied for a single IPv4/IPv6 address or range of IPv4/IPv6 addresses.	–	–
Destination IP/Mask	This option is available when ACL type is configured to an IPv4/IPv6 address. This field helps user to configure if rule needs to be applied for a single IPv4/IPv6 address or range of IPv4/IPv6 addresses.	–	–
Source MAC/Mask	This option is available when ACL type is configured to a MAC address. This field helps user to configure if rule needs to be applied for a single device MAC address or range of MAC addresses.	–	–
Destination MAC/Mask	This option is available when ACL type is configured to MAC address. This field helps user to configure if rule needs to be applied for a single device MAC address or range of MAC addresses.	–	–
Protocol	<p>This option is available when user selects ACL type as proto/proto6. User can select following protocols:</p> <ul style="list-style-type: none"> • TCP • UDP • ICMP • Any 	–	TCP
Source Port	Provision to apply ACL with combination of protocol and port.	–	–
Destination Port	Provision to apply ACL with combination of protocol and port.	–	–

Parameters	Description	Range	Default
Description	To make administrator easy to understand, a text string can be added for each ACL rule.	–	–
DNS-ACL			
Precedence	Provision to configure index of ACL rule. Packets are validated and processed based on Precedence value configured.	–	1
Action	Provision to configure whether to allow or deny traffic.	–	Deny
Domain	Provision to configure domain names and rules are applied based on Action configured.	–	–
MAC Authentication			
MAC Authentication Policy	<p>cnPilot supports multiple methods of MAC authentication. Following are details of each mode:</p> <ol style="list-style-type: none"> Permit Wireless station MAC addresses listed will be allowed to associate to AP. Deny When user configures a MAC address, those wireless station shall be denied to associate and the non-listed MAC address will be allowed. Radius For every wireless authentication, cnPilot sends a radius request and if radius accept is received, then wireless station is allowed to associate. cnMaestro This option is preferable when administrator prefers centralized MAC authentication policy. For every wireless authentication, AP sends query to cnMaestro if it allowed or disallowed to connect. Based on the configuration, wireless stations are either allowed or denied. 	–	Deny

To configure the above parameter, navigate to the **Configure > WLAN > Access** tab and provide the details as given below:

To configure **ACL**:

1. Select **Precedence** from the drop-down list.
2. Select type of **Policy** from drop-down list.
3. Select **Direction** from the drop-down list.
4. Select **Type** from the drop-down list.

5. Enter IP address of source in the **Source IP/Mask** textbox.
6. Enter IP address of destination in the **Destination IP/Mask** textbox.
7. Enter **Description** in the textbox.
8. Click **Save**.

To configure **DNS ACL**:

1. Select **Precedence** from the drop-down list.
2. Select type of action from **Action** drop-down list.
3. Enter domain name in the **Domain** textbox.
4. Click **Save**.

To configure **MAC Authentication**:

1. Select **MAC Authentication Policy** from the drop-down list.
2. Enter **MAC** in the textbox.
3. Enter **Description** in the textbox.
4. Click **Save**.

Table 29 Behavior of IP ACL when dual stack is enabled

IPv4 ACL Rule	IPv6 ACL Rule	Remark
No rule	No rule	All IPv4 and IPv6 allowed
IPv4 permit rule	No rule	All IPv6 packets dropped
No rule	IPv6 rule	All IPv4 packets dropped
IPv4 permit rule	IPv6 permit rule	All IPv4 and IPv6 allowed

Figure 32 Configure: WLAN > Access parameters

The screenshot displays the 'Access' configuration page for WLAN. It features three main sections: ACL, DNS-ACL, and MAC Authentication. Each section includes a 'Save' button and a table for listing rules. The ACL section has fields for Precedence (1), Policy (Deny), Direction (In), Type (IP), Source IP/Mask, and Destination IP/Mask. The DNS-ACL section has fields for Precedence (1), Action (Deny), and Domain. The MAC Authentication section has fields for MAC Authentication Policy (Deny), MAC, and Description. All tables are currently empty, displaying 'No Rules available' or 'No MAC Address available'.

Table 30 Configure: WLAN > Passpoint parameters

Parameters	Description	Range	Default
Configuration > Hotspot2.0 / Passpoint			
Enable	Passpoint (Release 2) enables a secure hotspot network access, online sign up and Policy Provisioning.	–	Disabled

Parameters	Description	Range	Default
DGAF	Downstream Group Addressed Forwarding, when enabled the WLAN doesn't transmit any multicast and broadcast packets.	–	Disabled
ANQP Domain ID	ANQP domain identifier included when the HS 2.0 indication element is in Beacon and Probe Response frames.	0-65535	0
Comeback Delay	Comeback Delay in milliseconds.	100-2000	0
Access Network Type	The configured Access Network Type is advertised to STAs. Following are the different network types supported: <ul style="list-style-type: none"> • Private • Chargeable Public • Emergency Services • Free Public • Personal Device • Private with Guest • Test • Wildcard 	–	Private
ASRA	Indicates that the network requires a further step for access.	–	Disabled
Internet	The network provides connectivity to the Internet if not specified.	–	Disabled
HESSID	Configures the desired specific HESSID network identifier or the wildcard network identifier.	–	–
Venue Info	Configure venue group and venue type.	–	–
Roaming Consortium	The roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP.	–	–
ANQP Elements	Select any one of the following: <ul style="list-style-type: none"> • 3GPP Cellular Network Information • Connection Capability • Domain Name List • Icons • IP Address Type information 	–	–

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> • NAI Realm List • Network Authentication Type • Operating Class Indication • Operator Friendly Names • OSU Provider List • Venue Name Information • WAN Metrics 		

To configure the above parameter, navigate to the **Configure > WLAN > Passpoint** tab and provide the details as given below:

1. Select **Enable** checkbox to enable passpoint functionality.
2. Select **DGAF** checkbox to enable Downstream Group Addressed Forwarding functionality.
3. Enter the domain identifier value in **ANQP Domain ID** textbox.
4. Enter **Comeback Delay** in milliseconds in the textbox.
5. Choose the **Access Network Type** value from the drop-down list.
6. Enable **ASRA** checkbox if the network requires additional steps for access.
7. Enable **Internet** checkbox for the network to provide connectivity to the Internet.
8. Enter the **HESSID** to configure the desired specific HESSID network identifier or the wildcard network identifier.
9. Select **Venue Info** from the drop-down list.
10. To add **Roaming Consortium** value, enter the value in the textbox and click **Add**. To delete a **Roaming Consortium** value, select from the drop-down list and click **Delete**.
11. Click **Save**.

HESSID					

Chapter 9: Configuration - Network

This chapter describes the following topics:

- [Overview](#)
- [Configuring Network parameters](#)

Overview

This chapter gives an overview of cnPilot configurable parameters related to LAN, VLAN, Routes, DHCP server, Tunnel, ACL and Firewall.

Configuring Network parameters

cnPilot network configuration parameters are segregated into following sections:

- VLAN
- Routes
- Ethernet Ports
- Security
- DHCP
- Tunnel
- PPPoE
- VLAN Pool

IPv4 network parameters

VLAN

Table 31 Configure: Network > VLAN > IPv4 parameters

Parameters	Description	Range	Default
VLAN > IPv4			
Edit	Provision to select the VLAN interface that user is intended to view/update configuration.	–	VLAN 1
Address	Provision to configure mode of IPv4 address configuration for an interface selected. Two modes are supported: <ol style="list-style-type: none"> DHCP This is the default mode in which cnPilot device tries to obtain IPv4 address from DHCP server. Static IP 	–	DHCP

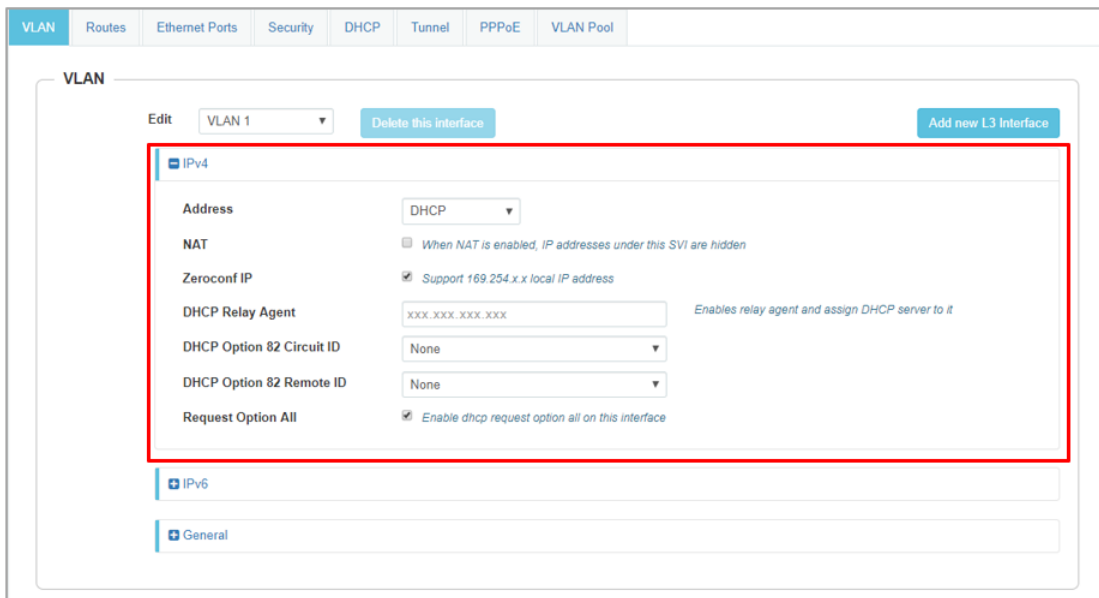

Parameters	Description	Range	Default
	User must explicitly configure IPv4 address and Netmask for a VLAN selected.		
NAT	This option is preferable when you defined local DHCP servers. This option when selected, traffic from wireless stations are NAT'ed to the default gateway interface IP.		Disabled
Zeroconf IP	Zeroconf IP is recommended to be enabled. This interface is available only on VLAN1 configuration section. If VLAN 1 is not allowed in Ethernet interfaces, this IP will not be accessible.	–	Enabled
DHCP Relay Agent	<p>This option is enabled when DHCP server is hosted on a VLAN which is not same as client that is requesting for DHCP IP. Enabling this appends Option 82 in the DHCP packets. Following information is allowed to configure:</p> <ol style="list-style-type: none"> DHCP Option 82 Circuit ID Configurable parameters under this option are as follows: <ul style="list-style-type: none"> • Hostname • APMAC • BSSID • SSID • Custom DHCP Option 82 Remote ID Configurable parameters under this option are as follows: <ul style="list-style-type: none"> • Hostname • APMAC • BSSID • SSID • Custom 	–	Disabled
Request Option All	<p>This configuration decides the interface on which cnPilot AP will learn the following:</p> <ul style="list-style-type: none"> • IPv4 default gateway • DHCP client options like Option 43 and Option 15 (Controller discovery like controller host name / IPv4 address) • DNS Servers • Domain Name 	–	Enabled on VLAN1

To configure the above parameter, navigate to the **Configure > Network > VLAN** tab and provide the details as given below:

To configure **VLAN IPv4**:

1. Select **Edit** checkbox to enable VLAN1 functionality.
2. Enable **DHCP** or **Static IP** mode of IPv4 address configuration from the **Address** checkbox.
3. Enable **NAT** checkbox.
4. Enable **Zeroconf IP** checkbox.
5. Enter **DHCP Relay Agent** parameter in the textbox.
6. Select **DHCP Option 82 Circuit ID** from the drop-down list.
7. Select **DHCP Option 82 Remote ID** from the drop-down list.
8. Enable **Request Option All** checkbox.
9. Click **Save**.

Figure 34 Configure: Network > VLAN > IPv4 parameters

MTU

cnPilot devices honour MTU advertised in DHCP Option 26. Below are the criteria for selecting MTU:

- By default, MTU is updated only if option 26 value is between 1500 - 1600 bytes.
- If user requires MTU less than 1500 bytes as advertised in option 26, enable MTU option as follows:

```
E430-6E3A07(config)# interface vlan <VLAN ID>
E430-6E3A07(config-vlan-<VLAN ID>)# ip dhcp mtu
E430-6E3A07(config-vlan-<VLAN ID>)# save
```

DHCP Client Options

cnPilot devices learn multiple DHCP options for all VLAN interfaces configured on the device. Based on configured criteria, values of these options are used by the system. Below table lists the different DHCP options.

Table 32 DHCP Options

Options	Description	Usage	Reference CLI
Option 1	The subnet mask option specifies the client’s subnet mask as per RFC 950.	Based on state of “Request Option All”, device chooses subnet mask from respective VLAN interface.	show ip route
Option 3	This option specifies a list of IP addresses for routers on the client’s subnet.	Based on state of “Request Option All”, device chooses route learnt from respective VLAN interface. Only first route is honored	show ip route
Option 6	The domain name server option specifies a list of Domain Name System (STD 13, RFC 1035) name servers available to the client. Servers SHOULD be listed in order of preference.	Based on state of “Request Option All”, device chooses subnet mask from respective VLAN interface. Top two DNS servers are honored by cnPilot device.	show ip name-server
Option 15	This option specifies the domain name that client should use when resolving hostnames via the Domain Name System.	More details are provided in DHCP Option 15/24 .	show ip dhcp-client info
Option 26	This option specifies MTU size in a network.	More details are provided in MTU .	show ip dhcp-client info

Options	Description	Usage	Reference CLI
Option 28	This option specifies the broadcast address that client should use	Broadcast address learnt for all VLAN interfaces are used respectively as per standards	<code>show ip dhcp-client-info</code>
Option 43	This option is used to help the AP in obtaining cnMaestro IP address from the DHCP server while DHCP request to get an IP address is sent to the DHCP server.	<p>More details are provided in IPv4</p> <p>DHCP Option 43/52</p> <p>DHCP Option 15/24</p> <ul style="list-style-type: none"> ○ IPv6 ○ DHCP Option 43/52 ● DHCP Option 15/24 <p>DHCP Option 43/52.</p>	<code>show ip dhcp-client info</code>
Option 51	This option is used in a client request to allow the client to request a lease time for the IP address. In a server reply, a DHCP server uses this option to specify the lease time it is willing to offer.	cnPilot renew leases for all VLAN interfaces configured based on lease time that has been learned from DHCP server.	<code>show ip dhcp-client info</code>
Option 54	DHCP clients use the contents of the 'server identifier' field as the destination address for any DHCP messages unicast to the DHCP server.	cnPilot learns DHCP server IP for all VLAN interfaces configured.	<code>show ip dhcp-client info</code>
Option 60	This option is used by DHCP clients to optionally identify the vendor type and configuration of a DHCP client.	For cnPilot device, value is updated as Cambium-WiFi-AP.	<code>show ip dhcp-client info</code>

Routing & DNS

Table 33 Configure: Network > VLAN > Routing & DNS > IPv4 parameters

Parameters	Description	Range	Default
Default Gateway	Provision to configure default gateway. If this is provided, cnPilot device installs this gateway as this is the highest priority.	–	–
DNS Server	Provision to configure Static DNS server on cnPilot device. Maximum of two DNS servers can be configured.	–	–
Domain Name	Provision to configure Domain Name. If this is provided, cnPilot device installs this Domain Name as this is highest priority.	–	–
DNS Proxy	cnPilot device can acts as DNS proxy server when this parameter is enabled.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > VLAN > Routing & DNS** tab and provide the details as given below:

1. Enter **Default Gateway** IPv4 address in the textbox.
2. Enter **Domain Name** in the textbox.
3. Enter primary domain server name in the **DNS Server 1** textbox.
4. Enter secondary domain server name in the **DNS Server 2** textbox.
5. Enable **DNS Proxy** checkbox.
6. Click **Save**

Figure 35 Routing & DNS > IPv4 parameters

The screenshot shows the 'Routing & DNS' configuration page. The 'IPv4' section is highlighted with a red border and contains the following fields:

- Default Gateway:** A text input field with the placeholder text 'IP address of default gateway'.
- DNS Server 1:** A text input field with the placeholder text 'Primary Domain Name Server'.
- DNS Server 2:** A text input field with the placeholder text 'Secondary Domain Name Server'.
- Domain Name:** A text input field with the placeholder text 'Domain name'.
- DNS Proxy:** A checkbox labeled 'DNS Proxy'.

Below the IPv4 section, there is an 'IPv6' section which is currently collapsed. At the bottom of the page, there are 'Save' and 'Cancel' buttons.

Routes

Table 34 Configure: Network > Routes> IPv4 parameters

Parameters	Description	Range	Default
Gateway Source Precedence	Provision to prioritize default gateway and DNS servers when cnPilot device has learnt from multiple ways. Default order is Static, DHCP and PPPoE.	–	Static
Add Multiple Route Entries	User has provision to configure static Routes. Parameters that are required to configure static Routes are as follows: <ul style="list-style-type: none"> • Destination IP • Mask • Gateway 	–	–
Port Forwarding	This feature is required when wireless stations are behind NAT. User can access the services hosted on wireless stations using this feature. Following configurable parameters are required to gain the access of services hosted on wireless stations which are behind: <ul style="list-style-type: none"> • Port • IP Address • Type 	–	–

To configure the above parameter, navigate to the **Configure > Network > Routes** tab and provide the details as given below:

To configure **Gateway Source Precedence**:

1. Select **STATIC**, **DHCP** or **PPPoE** from the **Gateway Source Precedence** checkbox.
2. Click **Save**.

To configure **Add Multiple Route Entries**:

1. Enter **Destination IP** address in the textbox.
2. Enter **Mask** IPv4 address in the textbox.
3. Enter **Gateway** IPv4 address in the textbox.
4. Click **Save**.

To configure **Port Forwarding**:

1. Enter **Port** in the textbox.
2. Enter **IP Address** in the textbox.
3. Select **Type** from the drop-down list.
4. Click **Save**.

IPv6 network parameters

VLAN

Table 35 Configure: Network > VLAN > IPv6 parameters

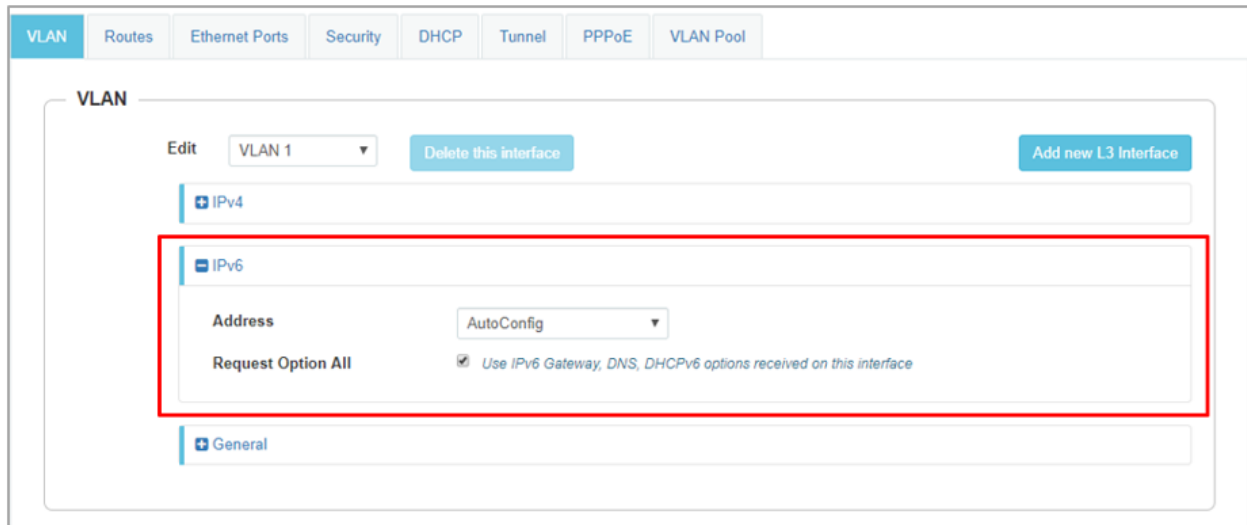

Parameters	Description	Range	Default
Address	Provision to configure mode of IPv6 address configuration for an interface selected. Five modes are supported: <ul style="list-style-type: none"> • Disabled • AutoConfig • Static • Stateless DHCPv6 • Stateful DHCpv6 		AutoConfig
Request Option All	This configuration decides the interface on which cnPilot AP will learn the following: <ul style="list-style-type: none"> • IPv6 default gateway • DHCP client options like Option 52 and Option 24 (Controller discovery like controller host name / IPv6 address) • DNS Servers • Domain Name 	–	Enabled on VLAN1

To configure the above parameter, navigate to the **Configure > Network > VLAN** tab and provide the details as given below:

To configure **VLAN IPv6**:

1. Select required IPv6 address configuration from the **Address** drop-down list.
2. Enable **Request Option All** checkbox.
3. Click **Save**.

Figure 37 Configure: Network > VLAN > IPv6 parameters

Routing & DNS

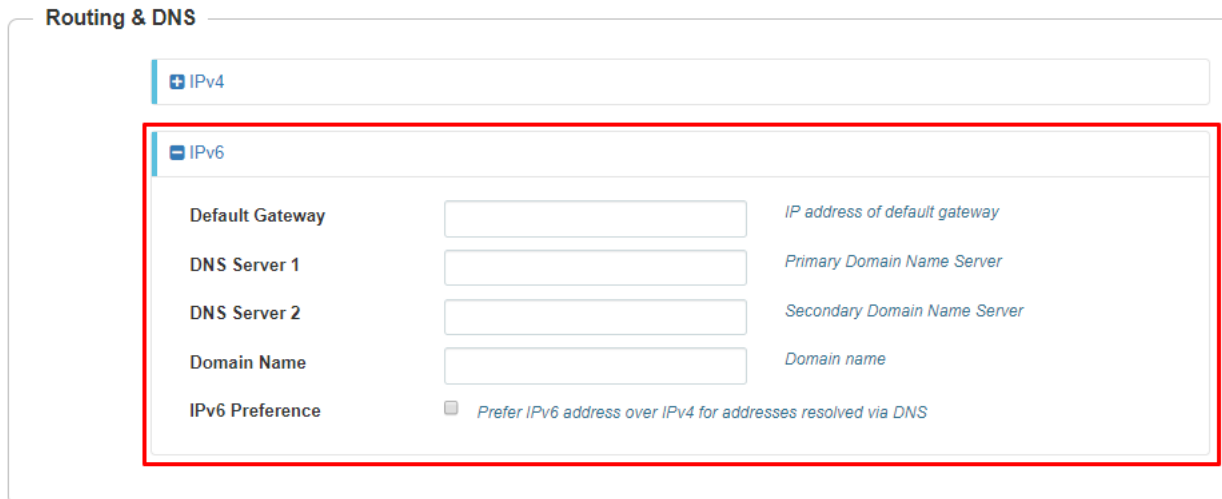

Table 36 Configure: Network > VLAN > Routing & DNS > IPv6 parameters

Parameters	Description	Range	Default
Default Gateway	Provision to configure default gateway. If this is provided, cnPilot device installs this gateway as this is the highest priority.	–	–
DNS Server	Provision to configure Static DNS server on cnPilot device. Maximum of two DNS servers can be configured.	–	–
Domain Name	Provision to configure Domain Name. If this is provided, cnPilot device installs this Domain Name as this is highest priority.	–	–
IPv6 Preference	When enabled, IPv6 is preferred over IPv4 bases on DNS response.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > Routing & DNS** tab and provide the details as given below:

1. Enter **Default Gateway** IPv6 address in the textbox.
2. Enter primary domain server name in the **DNS Server 1** textbox.
3. Enter secondary domain server name in the **DNS Server 2** textbox.
4. Enter **Domain Name** in the textbox.
5. Enable **IPv6 Preference** checkbox.
6. Click **Save**

General network parameters

Table 38 Configure: Network > VLAN > General parameters

Parameters	Description	Range	Default
Management Access	Provision to restrict the access of device in all modes CLI (Telnet, SSH), GUI (HTTP, HTTPS) and SNMP. User can configure restriction of device access as follows: <ul style="list-style-type: none"> Block Allow from Wired Allow from both wired and wireless 	–	Allow from both Wired and Wireless

Select **Management Access** to configure restriction of device from the drop-down list.

Figure 40 Configure: Network > VLAN > General parameters

Ethernet Ports

Table 39 Configure: Network > Ethernet Ports parameters

Parameters	Description	Range	Default
Ethernet	cnPilot devices Ethernet port is provisioned to operate in following modes: <ol style="list-style-type: none"> Access Single VLAN Single VLAN traffic is allowed in this mode. Trunk Multiple VLANs Multiple VLANs are supported in this mode. Tunnel Mode 	–	Access

Parameters	Description	Range	Default
	Provision to enable L2GRE tunnel. It is applicable only for Ethernet 2/3/4 ports of the cnPilot devices based on model number.		
Port Speed	Provision to configure ethernet link speed. <ul style="list-style-type: none"> • Auto • 10 Mbps • 100 Mbps • 1000 Mbps 	-	Auto
Port Duplex	Provision to configure ethernet link duplex settings.	Half Duplex/ Full Duplex	Full Duplex
MAC Authentication			
MAC Authentication	Provision to configure MAC Authentication.	-	-
MAC Auth Failed	Enabling this will allow traffic to pass on native VLAN when MAC Auth is rejected by RADIUS server.	-	-
MAC Authentication Policy	Provision to set MAC ACL policy from external RADIUS server. <ul style="list-style-type: none"> • Delimiter: Only colon (:) and hyphen (-) are accepted • Upper-Case: MAC address sent in upper case only 	-	-
Radius Server			
Authentication Server	Provision to configure RADIUS Authentication server details such as Hostname/IPv4/IPv6, Shared Secret, Port Number and Realm. Maximum of three RADIUS server can be configured.	-	Disabled
Accounting Server	Provision to configure Accounting server details such as Hostname/IPv4/IPv6, Shared Secret, Port Number. Maximum of three RADIUS server can be configured.	-	Disabled
Timeout	Wait time period for response from AAA server.	1-30	3
Attempts	Parameter to configure number of attempts that a device should send AAA request to server if no response is received within configured timeout period.	1-3	1
Accounting Mode	This field is enabled based on customer requirement. Accounting packet is transmitted based on mode selected. <ol style="list-style-type: none"> 1. Start-Stop 	-	None

Parameters	Description	Range	Default
	<p>Accounting packets are transmitted by AP to AAA server when a wireless station is connected and then disconnects.</p> <p>2. Start-Interim-Stop</p> <p>Accounting packets are transmitted by AP to AAA server when a wireless station connects and then at regular intervals of configured Interim Update Interval and then when it disconnects.</p> <p>3. None</p> <p>Accounting mode will be disable.</p>		
Server Pool Mode	<p>User can configure multiple Authorization and Accounting servers. Based on number of wireless stations, user can choose either Failover or Load Balance mode.</p> <p>1. Load Balance</p> <p>AP communicates with multiple servers and ensures that authorization and accounting are equally shared across configured servers.</p> <p>2. Failover</p> <p>AP selects the RADIUS server which is up and running based on the order of configuration.</p>	-	Load Balance
NAS Identifier	<p>This is configurable parameter and is appended in RADIUS request packet.</p> <p>1. AP-ETH0-MAC:</p> <p>NAS identifier attribute will be ETH0 MAC address</p> <p>2. AP-HOSTNAME</p> <p>NAS identifier attribute will be AP hostname</p> <p>3. Custom:</p> <p>Any custom value</p>	-	Hostname/ System Name
NAS IP	<p>NAS-IP attribute for use in RADIUS request packets. Default is set to device IP and option to configure custom IP address with the option Custom.</p>	-	AP-IP
Called Station ID	<p>Following information can be communicated to RADIUS server:</p> <ul style="list-style-type: none"> • AP-MAC • AP-MAC: SITE-NAME • AP-NAME • AP-NAME: SITE-NAME • SITE-NAME 		AP-MAC

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> CUSTOM 		
Interim Update Interval	This field is used when RADIUS accounting is enabled, and mode selected as Start-Interim-Stop.	10-65535	1800
Dynamic Authorization	This option is required, where there is a CoA requests from AAA/RADIUS server.	–	Disabled
ACL			
Precedence	Provision to configure index of ACL rule. Packets are validated and processed based on precedence value configured.	1-256	1
Policy	Provision to configure whether to permit or deny traffic.	Deny/Permit	Deny
Direction	Provision to apply the ACLs rules configured either in any direction or specific direction.	–	In
Type	<p>cnPilot devices support three layers of ACLs. A rule can be configured as below:</p> <ul style="list-style-type: none"> IP IPv6 MAC Proto Protov6 	–	IP
Source IP/Mask	This option is available when ACL type is configured to an IP address. This field helps user to configure if rule needs to be applied for a single IP address or range of IP addresses.	–	–
Destination IP/Mask	This option is available when ACL type is configured to an IP address. This field helps user to configure if rule needs to be applied for a single IP address or range of IP addresses.	–	–
Source MAC/Mask	This option is available when ACL type is configured to a MAC address. This field helps user to configure if rule needs to be applied for a single device MAC address or range of MAC addresses.	–	–
Destination MAC/Mask	This option is available when ACL type is configured to MAC address. This field helps user to configure if rule needs to be applied for a single device MAC address or range of MAC addresses.	–	–

Parameters	Description	Range	Default
Protocol	This option is available when user selects ACL type as proto. User can select following protocols: <ul style="list-style-type: none"> • TCP • UDP • ICMP • Any 	–	TCP
Source Port	Provision to apply ACL with combination of protocol and port.	–	–
Destination Port	Provision to apply ACL with combination of protocol and port.	–	–
Description	To make administrator easy to understand, a text string can be added for each ACL rule.	–	–

To configure the above parameter, navigate to the **Configure > Network > Ethernet Ports** tab and provide the details as given below:

1. Select **Access Single VLAN** or **Trunk Multiple VLANs** from the **ETH1** drop-down list.
2. Enter **Access Mode** in the textbox.
3. Select **Port Speed** from the drop-down list.
4. Select **Port Duplex** from the drop-down list.
5. Click **Save**.

To Configure **MAC Authentication**:

1. Enable **MAC Authentication** checkbox
2. Click **Save**.

To configure **Radius Server**:

1. Enter the RADIUS Authentication server details such as Hostname/Shared Secret/Port Number/Realm in the **Authentication Server 1** textbox.
2. Enter the time in seconds of each request attempt in **Timeout** textbox.
3. Enter the number of attempts before a request is given up in the **Attempts** textbox.
4. Select the configuring **Accounting Mode** from the drop-down list.
5. Enable **Load Balance/Failover** in the **Server Pool Mode** checkbox.
6. Enter the **Interim Update Interval** parameter value in the textbox.
7. Enable **Dynamic Authorization** checkbox to configure dynamic authorization for wireless clients.
8. Click **Save**.

To configure **ACL**:

1. Select **Precedence** from the drop-down list.
2. Select type of **Policy** from the drop-down list.
3. Select **Direction** from the drop-down list.

4. Select **Type** from the drop-down list.
5. Enter IP address of source in the **Source IP/Mask** textbox.
6. Enter IP address of destination in the **Destination IP/Mask** textbox.
7. Enter **Description** in the textbox.
8. Click **Save**.

Security

Table 40 Configure: Network > Security parameters

Parameters	Description	Range	Default
DoS Protection	<p>cnPilot devices has inbuilt capability of detecting DoS attacks on wired network. Following are the attacks that are detected by cnPilot devices:</p> <ul style="list-style-type: none"> • IP Spoof • Smurf Attack • IP Spoof Log • ICMP Fragment 	–	Disabled
Rogue AP			
Detection	<p>cnPilot devices in association with cnMaestro has capability of detecting Rogue APs. On enabling this all neighbor information is shared to cnMaestro and reports Rogue APs in the networks.</p>	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > Security** tab and provide the details as given below:

1. Select any of the following from **DoS Protection** checkbox
 - a. IP Spoof
 - b. Smurf Attack
 - c. IP Spoof Log
 - d. ICMP Fragment
2. Enable **Detection** checkbox.
3. Click **Save**.

DHCP

Table 41 Configure: Network > DHCP parameters

Parameters	Description	Range	Default
Edit	Provision to select DHCP Pool if multiple Pools are defined on cnPilot device.	-	-
Address Range	User can configure start and end addresses for a DHCP Pool selected from the drop-down box.	-	-
Default Router	Provision to configure next hop for a DHCP pool selected from drop-down box.	-	-
Domain Name	Provision to configure domain name for a DHCP pool selected from drop-down box.	-	-
DNS Address	Provision to configure DNS server for a DHCP pool selected from drop-down box.	-	-
Network	Provision to configure Network ID for a DHCP pool selected from drop-down box.	-	-
Lease	Provision to configure lease for a DHCP pool selected from drop-down box.	-	-
Add Bind List			
	For every DHCP pool configured, user can bind MAC and IP from the address pool defined, so that wireless station gets same IP address every time they connect. Following parameters are required to bind IP address:	-	-

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> • MAC Address • IP Address 		

To configure the above parameter, navigate to the **Configure > Network > DHCP** tab and provide the details as given below:

1. Select DHCP pool from the **Edit** drop-down list.
2. Enter start and end IP addresses for a DHCP Pool selected from the **Address Range** textbox.
3. Enter **Default Router** IP address in the textbox.
4. Enter **Domain Name** for a DHCP pool selected in the textbox.
5. Enter **DNS Address** for a DHCP pool selected in the textbox.
6. Enter **Network ID** for a DHCP pool selected in the textbox.
7. Enter **Lease** for a DHCP pool selected in the textbox.
8. Click **Save**.

To configure **Add Bind List**:

1. Enter **MAC Address** for a DHCP pool selected in the textbox.
2. Enter **IP Address** for a DHCP pool selected in the textbox.
3. Click **Save**.

Tunnel

Table 42 Configure: Network > Tunnel parameters

Parameters	Description	Range	Default
Tunnel Encapsulation	Provision to enable tunnel type. Following tunnel types are supported by cnPilot devices: <ul style="list-style-type: none"> L2TP L2GRE OFF 	–	OFF
L2TP			
Remote Host	Configure L2TP end point. Either IP or hostname of endpoint is supported.	–	–
Authentication Info	Provision to configure credentials required for L2TP authentication.	–	–
Auth Type	Provision to select the PPP authentication method. Following are the options available: <ul style="list-style-type: none"> DEFAULT CHAP MS-CHAP MS-CHAP v2 PAP 	–	Default
TCP MSS	Provision to configure TCP Maximum Segment Size.	422-1410	1400
PMTU Discovery	Provision to enable to discover PMTU in network.	–	Enabled
L2GRE			
Remote Host	Configure L2GRE end point. Either IPv4/IPv6 address or hostname of endpoint is supported.	–	–
DSCP	User can configure priority of GRE packets.	–	0
TCP MSS	Provision to configure TCP MSS value.	472-1460	1402
PMTU Discovery	Provision to enable to discover PMTU in network.	–	Enabled
MTU	Maximum Transmission Unit.	850-1460	1460

Parameters	Description	Range	Default
Cambium GRE	It's a proprietary GRE protocol designed using RFC 8086 to establish tunnel between cnMaestro c4000 Controller and cnPilot devices.	-	Disabled
GRE in UDP	GRE protocol designed to establish tunnel between any third-party vendor which complies RFC 8086.	-	Disabled

To configure the above parameter, navigate to the **Configure > Network > Tunnel** tab and provide the details as given below:

1. Select Tunnel type from the **Tunnel Encapsulation** drop-down list.

To configure **L2TP**:

2. Enter IP address or domain name in the **Remote Host** textbox.
3. Enter credentials required for L2TP authentication in the Authentication Info textbox.
4. Select authentication type from the Auth Type drop-down list.
5. Enter TCP Maximum Segment Size in the TCP MSS textbox.
6. Enable PMTU Discovery checkbox.
7. Enter Maximum Transmission Unit in the MTU textbox.
8. Click Save.

To configure **L2GRE**:

9. Enter IP address or domain name in the Remote Host textbox.
10. Enter DSCP in the textbox.
11. Enter TCP Maximum Segment Size in the TCP MSS textbox.
12. Enable PMTU Discovery checkbox.
13. Enter Maximum Transmission Unit in the MTU textbox.
14. Enable **Cambium GRE** checkbox.
15. Enable **GRE in UDP** checkbox.
16. Click Save.

PPPoE

Table 43 Configure: Network > PPPoE parameters

Parameters	Description	Range	Default
Enable	Provision to enable PPPoE client.	–	Disable
VLAN	User can configure VLAN ID where PPPoE client should obtain IP address.	–	–
Service Name	Configure PPPoE service name	–	–

Parameters	Description	Range	Default
Authentication Info	Provision to configure credentials required for PPPoE authentication.	–	–
MTU	Maximum Transmission Unit.	500-1492	1430
TCP MSS Clamping	Configure PPPoE end point. Either IP or hostname of endpoint is supported.	–	Enabled
Management Access	If enabled, user can access device either using UI or SSH with PPPoE IP.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > PPPoE** tab and provide the details as given below:

1. Select **Enable** checkbox to enable PPPoE functionality.
2. Enter the VLAN ID assigned to the PPPoE in the VLAN textbox.
3. Enter **Service Name** in the textbox.
4. Enter the username and password for the device in the **Authentication Info** textbox.
5. Enter the MTU value PPPoE connection in the **MTU** textbox.
6. Enable the TCP MSS clamping for the PPPoE connection.
7. Enable **Management Access**.
8. Click **Save**.

Figure 45 Configure: Network > PPPoE parameters

The screenshot shows the configuration page for PPPoE. At the top, there are tabs for VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE (selected), and VLAN Pool. The main configuration area contains the following elements:

- Enable:** A checkbox that is currently unchecked.
- VLAN:** A text input field containing the value '1'. A tooltip below it reads 'Vlan ID assigned to PPPoE'.
- Service Name:** An empty text input field. A tooltip below it reads 'Configure pppoe service-name parameters'.
- Authentication Info:** Two text input fields. The first contains 'admin' and the second contains '.....'. A tooltip for the second field reads 'Max 64 characters'.
- MTU:** A text input field containing the value '1430'. A tooltip below it reads 'Configure mtu for pppoe connection (500-1492 bytes)'.
- TCP-MSS Clamping:** A checked checkbox with a tooltip that reads 'Enable tcp mss clamping for pppoe connection'.
- Management Access:** An unchecked checkbox with a tooltip that reads 'Enable CLI/GUI/SNMP access via this interface'.

At the bottom of the configuration area, there are two buttons: 'Save' and 'Cancel'.

VLAN Pool

Table 44 Configure: Network > VLAN Pool parameters

Parameters	Description	Range	Default
VLAN Pool Name	Provision to configure user friendly name to a list of VLANs.	–	–
VLAN ID List	List of VLAN IDs for each VLAN Pool name. User can configure either single VLAN ID or multiple VLAN ID. Multiple VLAN IDs can be configured either separated by comma or hyphen.	–	–

To configure the above parameter, navigate to the **Configure > Network > VLAN Pool** tab and provide the details as given below:

1. Enter the name of the VLAN pool in the **VLAN Pool Name** textbox.
2. Enter the VLAN ID in the **VLAN ID List** textbox.
3. Click **Save**.

Figure 46 Configure: Network > VLAN Pool parameters

The screenshot shows the configuration page for a VLAN Pool. At the top, there are navigation tabs: VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE, and VLAN Pool (which is active). Below the tabs, there are two input fields: 'VLAN Pool Name' with the value 'Vlan Pool Name' and 'VLAN ID List' with the value '1-4094'. Below these fields is a table with three columns: 'VLAN Pool Name', 'VLAN ID List', and 'A...'. The table is currently empty, displaying 'No list available'. At the bottom of the table are navigation controls including arrows, a page number '1 / 1', and a dropdown for '10 items per page'. 'Save' and 'Cancel' buttons are located at the bottom of the configuration area.

WWAN

Note

This feature is supported in cnPilot e600 platform only.

Table 45 Configure: Network > WWAN

Parameters	Description	Range	Default
WWAN	Provision to enable wireless WAN using a USB cellular dongle for internet access.	–	–
Failover Only	Failover only can be configured in two modes: <ul style="list-style-type: none"> Checked: Ethernet will be the primary connection and WWAN will be backup. Unchecked. 3G/4G (WWAN) will be the only working connection. Note: Cellular link can be configured as backup only to Ethernet connection.	Checked/ Unchecked	–
APN	Provision to configure network provider APN address.	–	–
Authentication	Provision to configure credentials required for WWAN authentication.	–	–
Monitor Host	Running a check in the background that constantly monitors a user configured IP address (Ex: 8.8.8.8) for reachability through ping.	IPv4 address	–

To configure the above parameter, navigate to the **Configure > Network > WWAN** tab and provide the details as given below:

1. Enable **WWAN** checkbox to enable this functionality.
2. Check/Uncheck **Failover Only** to enable/disable.
3. Enter the APN address in the textbox.
4. Enter the authentication credentials.
5. Enter any IPv4 address to monitor.
6. Click **Save**.

Figure 47 Configure: Network > WWAN parameters

WWAN *Enable Wireless WAN using a USB cellular dongle for Internet access*

Failover Only *Use WWAN as backhaul only when failover is triggered*

APN *Configure network provider APN address*

Authentication *Configure authentication parameters*

Monitor Host *Host to monitor in order to trigger WWAN failover*

Chapter 10: Configuration - Services

This chapter describes the following topics:

- [Overview](#)
- [Configuring Services](#)

Overview

This chapter gives an overview of cnPilot configurable parameters related to LDAP, NAT Logging, Location API, Speed Test and DHCP Option 82.

Configuring Services

This section provides information on how to configure the following services on cnPilot AP.

- [LDAP](#)
- [NAT Logging](#)
- [Location API](#)
- [Speed Test](#)
- [DHCP Option 82](#)

LDAP

Table 40 lists the fields that are displayed in the **Configuration > Services > LDAP** tab:

Table 46 Configure: Services > LDAP parameters

Parameters	Description	Range	Default
Server Host	Provision to configure IP/Hostname of LDAP server.	–	–
Server Port	Provision to configure custom port number for LDAP services.	–	–

To configure the above parameter, navigate to the **Configure > Services > LDAP** tab and provide the details as given below:

1. Enter the IP address of the LDAP server in the **Server Host** textbox.
2. Enter the Port address of the LDAP server in the **Server Port** textbox.
3. Click **Save**.

Figure 48 Configure: Services > LDAP parameters

LDAP

Server Host *Configure LDAP server IP address*

Server Port *Configure LDAP server port address*

APIs

cnPilot devices does support APIs w.r.t to Wi-Fi client presence, NAT information and BT client presence.

NAT Logging

NAT logging is same as the internet access log that is generated when NAT is enabled on AP. Each internet access log PDU consists of one or more internet access log data in TLV format. The packet format for the internet access log PDU is defined as below:

Table 47 PDU type code: 0x82

Type	Mandatory	Length	Default Value
0x01	N	32 Bytes	Includes IPv4 internet access log data structure.

Type 0x01 TLV includes the internet access log data structure as below:

Table 48 NAT Logging Packet Structure

Length	Description
4 Bytes	NAT records UNIX time stamp which generates time in seconds from 1970-01-01 (00:00:00 GMT until now).
6 Bytes	The MAC address of the client.
1 Bytes	Reserved for future use.
1 Bytes	The protocol type. The supported protocol types are: <ul style="list-style-type: none"> • 0x06 TCP • 0x11 UDP
2 Bytes	The VLAN ID where the client is connected. If there is no VLAN ID, the value will be 0.
4 Bytes	The client internal or the private IP address.
2 Bytes	The internal port of the client.
4 Bytes	The Internet IP address which is translated by NAT.
2 Bytes	The Internet port which is translated by NAT.

Length	Description
4 Bytes	The IP address of the visited server.
2 Bytes	The port address of the visited server.

Table 43 lists the fields that are displayed in **Configuration > Services > NAT Logging** tab:

Table 49 Configure: Services > NAT Logging parameters

Parameters	Description	Range	Default
Enable	Provision to enable/disable NAT logging services.	–	–
Server IP	Provision to configure IP/Hostname of NAT logging server.	–	–
Server Port	Provision to configure custom port number for NAT Logging services.	–	–
Interval	Provision to configure frequency of logging.	5-3600	–

To configure the above parameter, navigate to the **Configure > Services > NAT Logging** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable NAT Logging.
2. Enter the IP address of the server for NAT Logging in the **Server IP** textbox.
3. Enter the IP address of the server port for NAT Logging in the **Server Port** textbox.
4. Enter the interval for NAT Logging in the **Interval** textbox.
5. Click **Save**.

Figure 49 Configure: Services > NAT Logging parameters

NAT Logging

Enable

Server IP *Configure NAT Logging server IP address*

Server Port *Configure NAT Logging server port address*

Interval *Configure NAT Logging interval (5-3600) seconds*

Location API

Location API is a method to send the discovered (Probed) clients list to a specified server address. The reports are sent as HTTP Post to the HTTP server every interval. The discovered client entries are deleted from the list if the entry is aged out. The client aging timeout is 2 times of location API interval configured. If there are no new probe requests from the client within 2xlocation API interval time, then the client entry will be removed from the list.

Table 44 lists the fields that are displayed in **Configuration > Services > Location API** tab:

Table 50 Configure: Services > Location API parameters

Parameters	Description	Range	Default
Enable	Provision to enable/disable Location API services.	–	–
Server	Provision to configure HTTP/HTTPs server to send report with the port number.	0-65535	–
Interval	Provision to configure custom frequency of information to be shared to server.	2-3600	–
MAC Anonymization	Provision to detect fake clients and avoid populating it in Location API client list.	–	–

To configure the above parameter, navigate to the **Configure > Services > Location API** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable Location API.
2. Enter the HTTP/HTTPs server and port number in the **Server** textbox.
3. Enter the interval for Location API in the **Interval** textbox.
4. Enable **MAC Anonymization** checkbox.
5. Click **Save**.

Figure 50 Configure: Services > Location API parameters

Location API

Enable

Configure HTTP/HTTPS server with the port number (0-65535)

Configure Location API interval (2-3600) seconds

MAC Anonymization *Ignore Anonymized MACs ⓘ*

Note

For further details about this feature and sample reference output, go to <https://support.cambiumnetworks.com/files/cnpilot-tech-ref/> and download **Wireless client Presence and Locationing API** document.

BT Location API

Bluetooth Scanning

cnPilot Aps with an integrated Bluetooth Low Energy (BLE) radio can detect and locate nearby Bluetooth Low Energy devices. This data is then provided via API to third-party applications. Examples of such devices include smartwatches, battery-based beacons, Apple iBeacons, fitness monitors, and remote sensors.

Organization can create use cases for indoor wayfinding and mapping, asset tracking, and more.

Below table lists the fields that are required for configuring BT Location API.

Table 51 Configuring BT Location API parameters

Parameters	Description	Range	Default
Location-bt-api server	Provision to configure details of destined API server.	-	-
Location-bt-api interval	Provision to configure the interval at which the BT information is updated to destined API server.	2-3600	2
Ignore-anonymized-bt-mac	Ignore client BT addresses that are anonymized.	-	-

Sending Report

After enabling BLE Scanning on AP it will start processing:

1. Convert the scanned data to a JSON array
2. Send that data in one single HTTP/HTTPS POST

In the CLI

To configuring the BT Location-API:

```
E500-BB164C(config)# location-bt-api
ignore-anonymized-bt-mac : Ignore MAC addresses that are anonymized
interval                  : Configure reporting interval in secs
server                    : HTTP/HTTPS server to send report to with the port number
```

To disable the BT Location-API:

```
E500-BB164C(config)# no location-bt-api
```

BT Location API data elements

Table 52 BT Location API data elements

Parameters	Description
apMac	MAC address of the observing AP.
API Version	API Version applied for particular data format.
AP Name	Host name of the observing AP.
Timestamp	Observation time in seconds seen by AP.
BT MAC	BLE device MAC seen by AP.
UUID	BLE device UUID seen by AP.
RSSI	BLE device RSSI as seen by AP.

HTTP POST Body Format:

```
{
  'u'ap_mac': '00-04-56-A5-5A-EC',
  'version': '2.2',
  'ap_name': 'E600-A55AEC',
  'ble_discoverd_clients':{Array of 0-250 devices}
}
```

Bluetooth API Data Format

```
{
  'bt_rssi': 'u' -80 dBm ',
  'bt_mac': '14-8F-21-FD-37-18', u
  'bt_uuids': 'Garmin International, Inc. (0xfe1f)\n',
  'bt_timestamp': 'u' 1.811127'
}
```

Speed Test

Wifiperf is a speed test service available on cnPilot devices. This tool is interoperable with open source zapwireless tool (<https://code.google.com/archive/p/zapwireless/>)

The wifiperf speed test can be triggered by using zapwireless tool between two cnPilot Aps or between cnPilot AP and with other third-party devices (or PC) that is having zapwireless endpoint running.

Refer <https://code.google.com/archive/p/zapwireless/> to download the zapwireless tool to generate zapwireless endpoint for third party device (or PC) and zap CLI to perform the test.

In this case, wifiperf endpoint should be enabled in cnPilot AP through UI shown below.

Table 45 lists the fields that are displayed in the **Configuration > Services > Speed Test** tab:

Table 53 Configure: Services > Speed Test parameters

Parameters	Description	Range	Default
wifiperf	Provision to enable wifiperf functionality.	–	Disabled

To configure the above parameter, navigate to the **Configure > Services > Speed Test** tab. Select **Wifiperf** checkbox to enable this functionality.

Figure 51 Configure: Services > Speed Test parameters

DHCP Option 82

Global parameter to configure DHCP Option 82 parameters that will be appended to DHCP packets when a device is connected either from wireless or wired to a cnPilot device. This parameter is given first precedence and overwrites any configuration defined in VLAN or WLAN profiles.

Table 46 lists the fields that are displayed in the **Configuration > Services > DHCP Option 82** tab:

Table 54 Configure: Services > DHCP Option 82 parameters

Parameters	Description	Range	Default
Enable	Provision to enable/disable DHCP Option 82 as global services.	–	–
Option 82 Circuit ID	When enabled, DHCP packets generated from wireless stations that are associated to APs are appended with Option 82 parameters. Option 82 provides provision to append Circuit ID and Remote ID. Following parameters can be selected in both Circuit ID and Remote ID: <ul style="list-style-type: none"> • None • All • Hostname • APMAC • SSID • VLAN ID • SITEID • Custom 	–	None

Parameters	Description	Range	Default
Option 82 Remote ID	<p>When enabled, DHCP packets generated from wireless stations that are associated to APs are appended with Option 82 parameters. Option 82 provides provision to append Circuit ID and Remote ID. Following parameters can be selected in both Circuit ID and Remote ID:</p> <ul style="list-style-type: none"> • None • Hostname • APMAC • SSID • VLAN ID • SITEID • Custom • All 	–	None
VLAN ID	User can configure VLAN IDs where DHCP Option 82 must be enabled.	1-4094	–

To configure the above parameter, navigate to the **Configure > Services** tab and select **DHCP Option 82** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable DHCP Option 82.
2. Select **Option 82 Circuit ID** to enable DHCP Option-82 circuit ID information from the drop-down list.
3. Select **Option 82 Remote ID** to enable DHCP Option-82 remote ID information from the drop-down list.
4. Enter **VLAN ID** parameter to configure VLAN to have DHCP Option 82.
5. Click **Save**.

Figure 52 Configure: Services > DHCP Option 82 parameters

DHCP Option 82

Enable *Insert DHCP Option 82 for all wireless and guest enabled wired clients*

Option 82 Circuit ID *Insert DHCP option 82 circuitID information*

Option 82 Remote ID *Insert DHCP option-82 remoteID information*

VLAN ID *Configure vlan to have DHCP Option-82 (1-4094)*

Chapter 11: Operations

This chapter describes the following topics:

- **Overview**
- **Firmware update**
- **System**
- **Configuration**

Overview

This chapter gives an overview of cnPilot administrative functionalities such as Firmware update, System and Configuration.

Firmware update

The running software on the cnPilot Enterprise AP can be upgraded to newer firmware. When upgrading from the UI the user can upload the firmware file from the browser. The same process can be followed to downgrade the AP to a previous firmware version if required. Configuration is maintained across the firmware upgrade process.

Note Once a firmware upgrade has been initiated, the AP should not be rebooted or power cycled until the process completes, as this might leave the AP inoperable.

Table 47 lists the fields that are displayed in the **Operations > Firmware update** tab:

Table 55 Configure: Operations > Firmware update parameters

Parameters	Description	Range	Default
Choose File	Provisions to select upgrade file.	–	–
Upgrade Firmware	Provision to initiate upgrade once file is selected.	–	–

To configure the above parameter, navigate to **Operations > Firmware update** tab and provide the details as given below:

1. Click **Choose File** and select the downloaded image file to upgrade the firmware manually.
2. Click **Upgrade Firmware** and select the downloaded image file to upgrade the firmware automatically.

You can view the status of upgrade in the **Upgrade Status** field.

Figure 53 Configure: Operations > Firmware update parameters

System

This section provides multiple troubleshooting tools provided by cnPilot Enterprises.

Table 56 lists the fields that are displayed in the **Operations > System** tab:

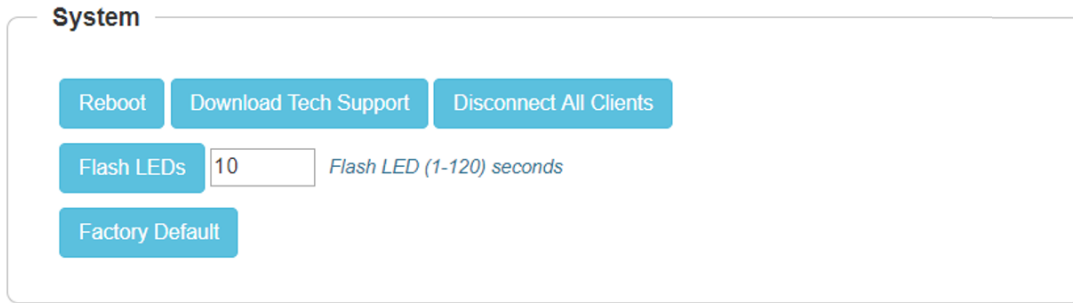

Table 56 Configure: Operations > System parameters

Parameters	Description	Range	Default
Reboot	User will be prompted with Reboot pop-up requesting for reboot. If Yes, device will go for reboot.	–	–
Download Tech Support	User will be prompted with permission to download tech-support from AP. If yes, file will be saved in your default download path configured on your system.	–	–
Disconnect All Clients	All clients connected to both the radios will be terminated by sending de-authentication packet to each client connected to radios.	–	–
Flash LEDs	LEDs on the device will toggle for configured time period.	1-120	10
Factory Default	A pop-up window appears requesting confirmation for factory defaults. If yes, device will delete all configuration to factory reset and reboots.	–	–

To configure the above parameter, navigate to **Operations > System** tab and provide the details as given below:

1. Click **Reboot** for rebooting the device.
2. Click **Download Tech Support** to generate a techsupport from the device and save it locally.
3. Click **Disconnect All Clients** to disconnect all wireless clients.
4. Select **Flash LEDs** value from the drop-down list to flash LEDs for the given duration of time.
5. Click **Factory Default** to delete all configuration on the device.

Figure 54 Configure: Operations > System parameters

Configuration

The device configuration can either be exported from the device as a text file or imported into the device from a previous backup. Ensure that when a configuration file is imported onto the device, a reboot is necessary to activate that new configuration.

Table 57 lists the fields that are displayed in the **Operations > Configuration** tab:

Table 57 Configure: Operations > Configuration parameters

Parameters	Description	Range	Default
Export	Provision to export configuration of device to default download path configured on system.	–	–
Import	Provision to import configuration of device.	–	–

To configure the above parameter, navigate to **Operations > Configuration** tab and provide the details as given below:

1. Click **Export** to export device configuration and save locally to the device.
2. Click **Import** to import device configuration to the device.

Figure 55 Configure: Operations > Configuration parameters

Chapter 12: Troubleshoot

This section provides detailed information about troubleshooting methods supported by cnPilot enterprise devices. Troubleshooting methods supported by cnPilot devices are categorized as below:

- **Logging**
 - Events
 - Debug Logs
- **RF**
 - Wi-Fi Analyzer
 - Spectrum Analyzer
 - Unconnected Clients
- **Packet Capture**
- **Performance**
 - Wi-Fi Perf Speed Test
 - Connectivity

Logging

cnPilot devices supports multi-level logging, which will ease to debug issues.

Events

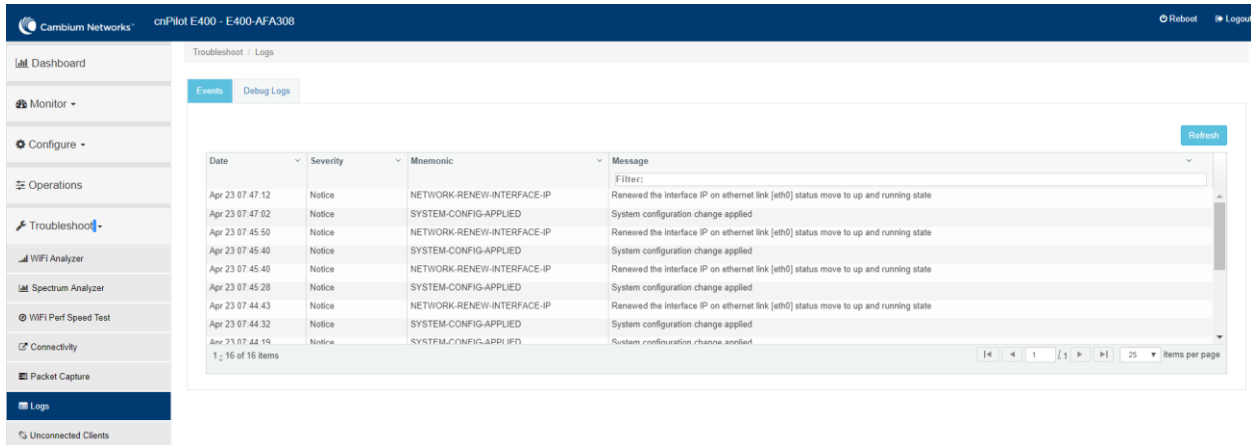

cnPilot devices generates events that are necessary for troubleshooting across various modules. Below is the list of modules, cnPilot device generates events for troubleshooting.

- Wireless station
 - Connectivity
- Configuration updates
- LDAP
 - Authentication
- RADIUS
 - Authentication
 - Accounting
 - CoA
- Mesh
- Roaming
 - Enhanced roaming
- Auto-RF
 - Channel change
- Tunnel state

- Reboot
- Guest Access
- Autopilot

Events are available at **Troubleshoot > Logs > Events**.

Figure 56 Troubleshoot > Logs > Events

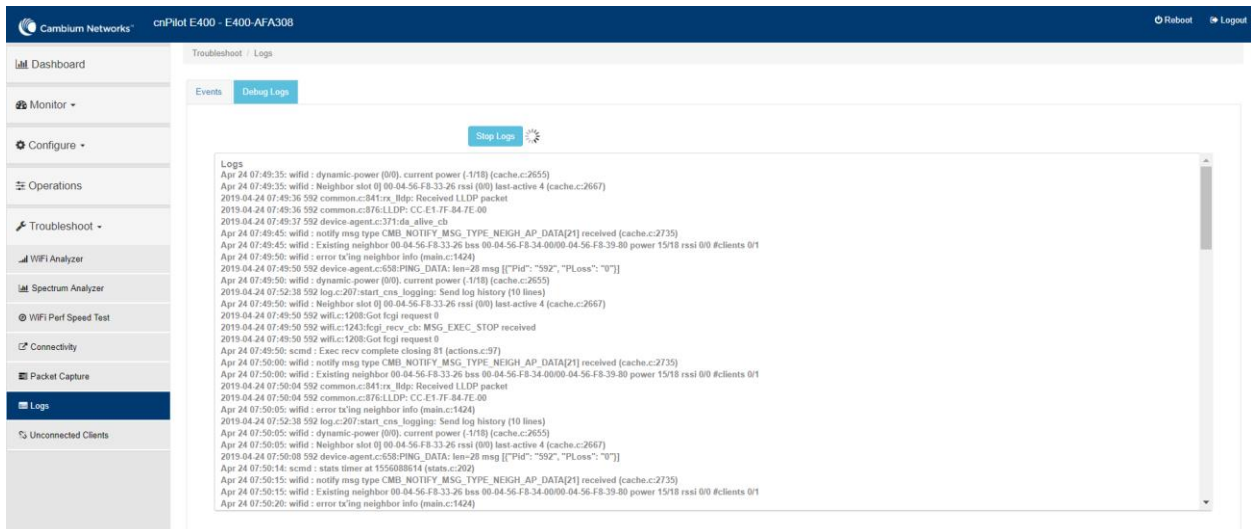

Debug Logs

cnPilot provisions enhanced debugging of each module as events generated by system and scope of debugging is limited. Debug logs can be triggered when user click **Start Logs** and can be terminated when clicked on **Stop Logs**. By default, debug logs auto terminate after 1 minute when clicked on **Start Logs**.

Debug logs are available at **Troubleshoot > Logs > Debug Logs**.

Figure 57 Troubleshoot > Logs > Debug Logs

Radio Frequency

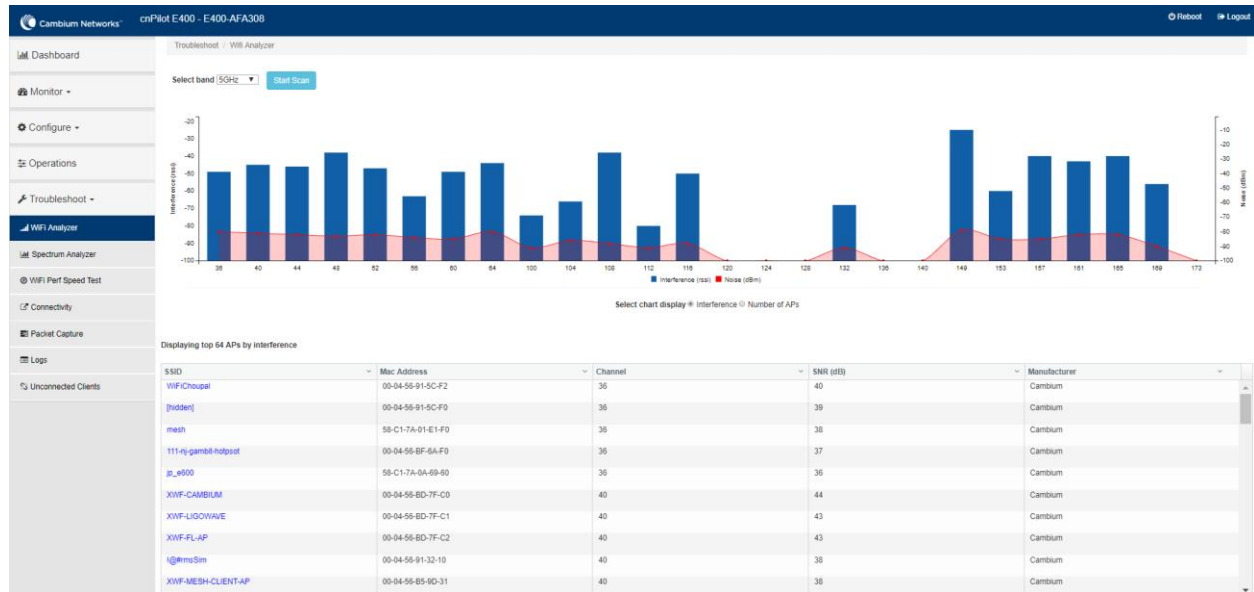

Wi-Fi Analyzer

This tool provisions customer to scan the channels supported as per regulatory domain and provides information related to AP's presence in each channel. Wi-Fi analyzer graphs are available in two modes:

- Interference
 - This tool shares more information of each channel as below:
 - Noise
 - Interference measured in RSSI
 - List of top 64 neighbor APs
- Number of APs
 - This tool shares more information of each channel as below:
 - Noise
 - Number of neighbor APs
 - List of top 64 neighbor APs

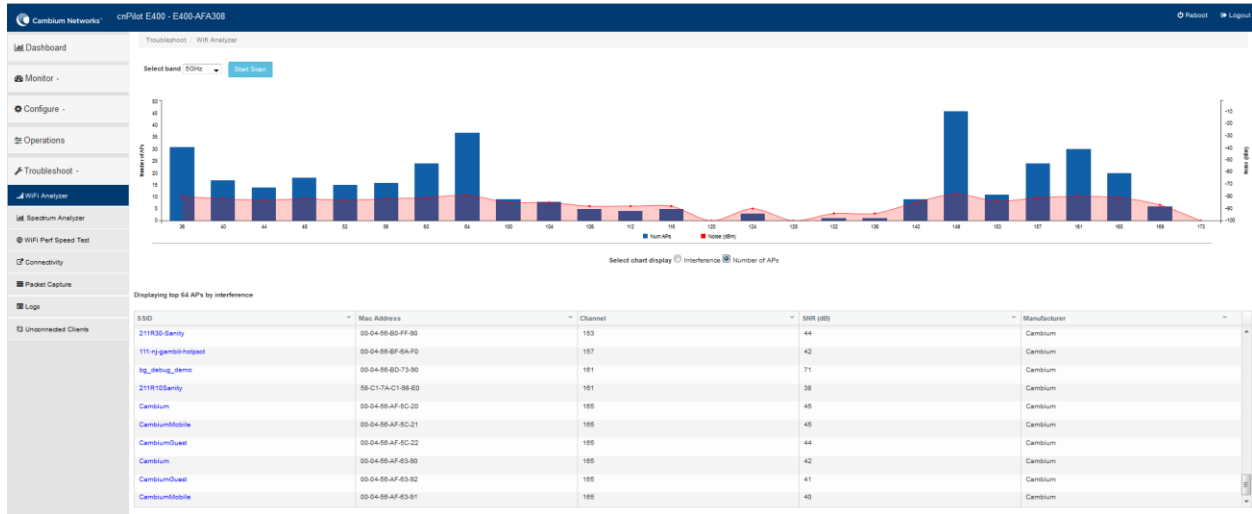

Channel analyzer is available at **Troubleshoot > Wi-Fi Analyzer > Interference Mode**.

Figure 58 Troubleshoot > Wi-Fi Analyzer > Interference Mode

Channel analyzer is available at **Troubleshoot > Wi-Fi Analyzer > Number of APs Mode**:

Figure 59 Troubleshoot > Wi-Fi Analyzer > Number of APs Mode

Spectrum analyzer

Due to heavy commercialization of Wi-Fi devices and wide range of non-Wi-Fi devices operating in the ISM band, interference in the ISM bands is unavoidable and imminent. The Wi-Fi performance can quickly degrade with the presence of these wide range of devices in the vicinity. The Wi-Fi network deployment is in need of more robust tools for RF spectrum analysis for determining potential Wi-Fi (and non-Wi-Fi) interferers for efficient planning of the network deployment.

Given the wide range deployment of high capacity Wi-Fi networks, it is inevitable that the devices come ready with automatic interference detection and mitigation. The spectral scan feature on cnPilot is the first step towards achieving the same.

Spectral analyzer is triggered on demand. Following options are required to trigger spectrum analyzer:

- **Band**
This feature is available on both 2.4GHz and 5GHz. At an instance, any one band can be selected
- **Continuous scan**
If user is looking for continuous scan until stopped, this field has to be enabled.
- **Scanning**
Option to start and stop the scan process.

Spectrum analyzer is available at **Troubleshoot > Spectrum Analyzer**.

Figure 60 Troubleshoot > Spectrum Analyzer

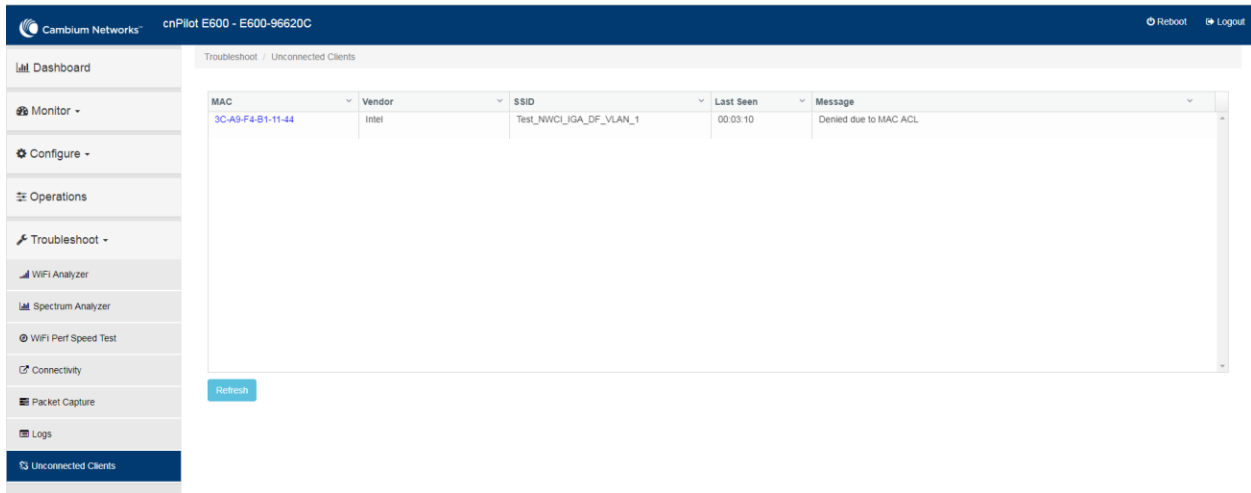

Unconnected clients

Unconnected clients provides a list of clients that could not connect properly due to various reasons with the Aps. Currently the following failures are tracked:

- Invalid pre-shared key
- EAP authentication failure
- Denied due to MAC ACL
- Client disconnected by enhanced-roaming

Figure 61 Unconnected clients

Packet capture

Allows the administrator to capture all packets on a specified interface. A decode of the packet indicating the network addresses, protocol types etc is displayed. The administrator can filter the packets being captured by specifying a particular MAC address, IP address, port number etc. The number of packets that are captured can also be capped, so the console or system is not overwhelmed. Packets captured on the ETH interfaces are packets that are being transmitted or received on the physical interface of the device.

cnPilot device allows packet capture on following interfaces:

- WLAN
- Ethernet
- VLAN
- SSID

Multiple options of filtering are provided and is available **Troubleshoot > Packet Capture page**:

Figure 62 Troubleshoot > Packet Capture page

Performance

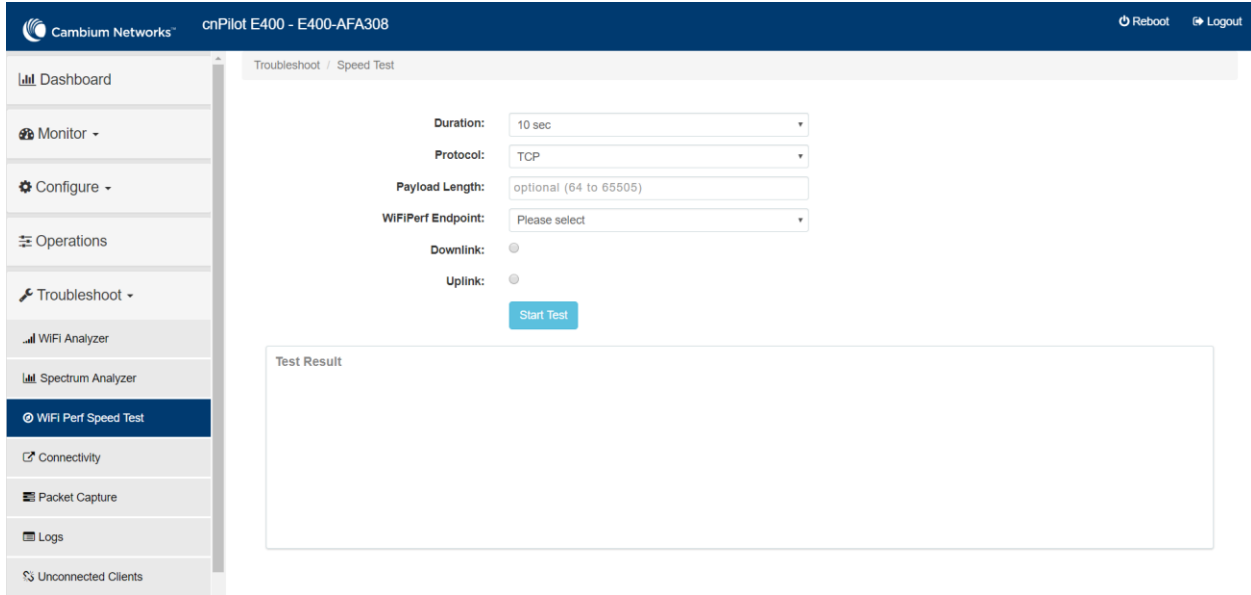

Wi-Fi Perf speed test

The Wi-Fi Perf Speed Test feature helps to measure the bandwidth from AP to an end point. You can measure both TCP and UDP with variable payloads. To configure this feature:

1. Navigate to **Troubleshoot > Wi-Fi Perf Speed Test** page in the UI.
2. Provide the following details:
 - Select the duration from the **Duration** drop-down list.
 - Select the Protocol as **UDP** or **TCP**.
 - Enter the length of the payload in the **Payload Length** textbox.
 - Enter the IP of the payload length in the **Wi-FiPerf Endpoint** textbox.
 - Select **Downlink** or **Uplink** Radio button.

3. Click on **Start Test**.

Figure 63 Troubleshoot > Wi-Fi Perf Speed Test

Speedtest on Access Point

Speedtest can be used to measure speed across the WAN to Cambium hosted servers. The CLI output displays uplink and downlink speed in Mbps. You can also host your own server in your data center and measure bandwidth to it using ETSI option and specifying the URL. The server software can be obtained from the LibreSpeed project <https://github.com/librespeed/speedtest>.

Configuration:

Syntax:

```
cnPilot-E400-202(config)# speedtest etsi
    <server url> <download MB> <upload MB>
cnPilot-E400-202(config)# speedtest etsi
```

Example 1:

```
cnPilot-E400-202(config)# speedtest etsi 10.110.211.19:9000 200 200
Your IP is 10.110.240.202 - private IPv4 access
Latency: 14.5ms Jitter: 1.3ms
Download: 169.53Mbps Upload: 93.93Mbps
```

Example 2:

```
E400-AE27D2(config)# speedtest
Your IP is 115.110.71.66
Test server located in Singapore, Singapore
Latency: 57.4ms Jitter: 2.0ms
Download: 26.48Mbps Upload: 26.00Mbps
```

Note
Cambium hosted server is chosen automatically

Connectivity

IPv4

This tool helps to check the accessibility of remote hosts from cnPilot device. Three types of tools are supported under this category:

- Ping
- DNS Lookup
- Traceroute

Table 58 Troubleshoot: Connectivity

Parameters	Description	Range	Default
Ping			
IP Address or Hostname	Provide IPv4 address or Hostname to validate the reachability of the destined Host.	-	-
Number of Packets	Provide number of request packets that are required to be transmitted to validate the reachability of destined Host.	1-10	3
Buffer Size	Configure ICMP packet size.	1-65507	56
Ping Result	Displays the ICMP results.	-	-
DNS Lookup			
Host Name	Provide Hostname whose IPv4 must be resolved.	-	-
DNS Test Result	Displays the IP's that are associated with configured Hostname.	-	-
Traceroute			
IP Address or Hostname	Provide IPv4 address or Hostname to validate the reachability of the destined Host.	-	-
Fragmentation	Provision to allow or deny fragment packets.	-	Off
Trace Method	Provision to configure payload mechanism to check the reachability of destined IPv4 Hostname.	-	ICMP Echo
Display TTL	Provision to customize TTL display.	-	On
Verbose	Provision to display the output of traceroute.	-	On

Parameters	Description	Range	Default
Traceroute Result	Displays the output of traceroute command.	-	-

To configure the above parameter, navigate to the **Troubleshoot > Connectivity** tab and provide the details as given below:

To configure **Ping**:

1. Select **Test type** from the drop-down list.
2. Enter **IPv4 address or Hostname** in the textbox.
3. Enter the **Number of packets** in the textbox.
4. Select **Buffer Size** value from the drop-down list.
5. Start **Ping**.

To configure **DNS Lookup**:

1. Enter the **Hostname** in the textbox.
2. Click **DNS Test**.

To configure **Traceroute**:

1. Enter **IPv4 address or Hostname** in the textbox.
2. Click **Fragmentation** to **ON/Off**.
3. Select **Trace Method** to either **ICMP Echo/UDP**.
4. Click **Display TTL** to **ON/Off**.
5. Click **Verbose** to **ON/Off**.
6. Click **Start Traceroute**.

Figure 64 Troubleshoot > Connectivity > Ping

Troubleshoot / Connectivity

Test Type : Ping

IP Address or Hostname :

Number of Packets : Min = 1, Max = 10

Buffer Size : Min = 1, Max = 65507

Ping Result
 PING www.google.com (216.58.197.68): 56 data bytes
 64 bytes from 216.58.197.68: seq=0 ttl=56 time=7.428 ms
 64 bytes from 216.58.197.68: seq=1 ttl=56 time=7.131 ms
 64 bytes from 216.58.197.68: seq=2 ttl=56 time=7.359 ms

--- www.google.com ping statistics ---
 3 packets transmitted, 3 packets received, 0% packet loss
 round-trip min/avg/max = 7.131/7.306/7.428 ms

Figure 65 Troubleshoot > Connectivity > DNS Lookup

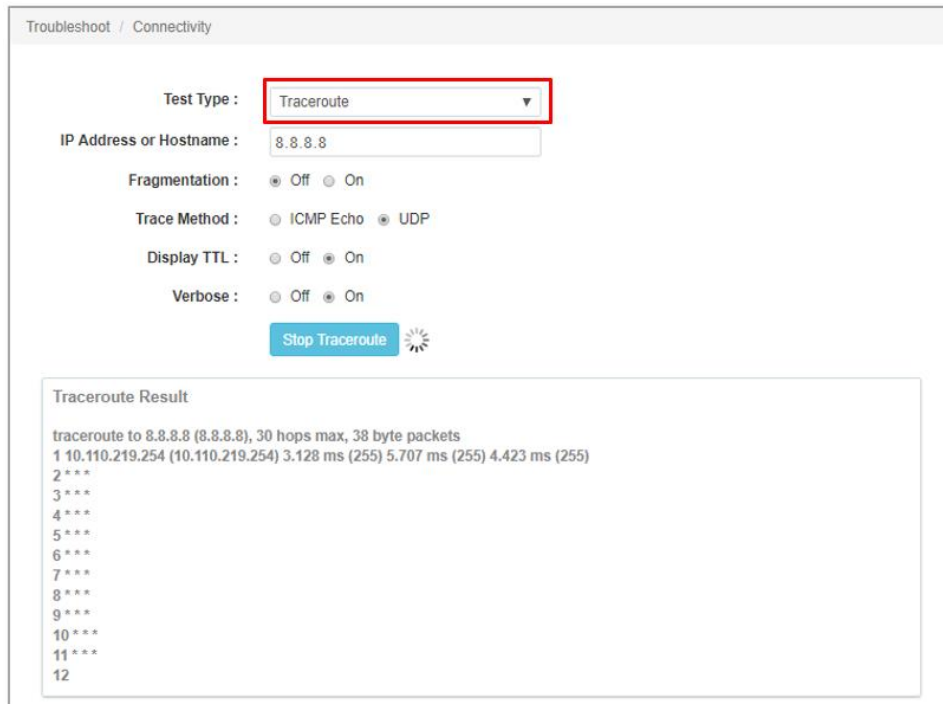

Troubleshoot / Connectivity

Test Type : DNS Lookup

Figure 66 Troubleshoot: Connectivity > Traceroute

IPv6

This tool helps to check the accessibility of remote hosts from cnPilot device. Three types of tools are supported under this category:

- Ping6
- DNS Lookup6
- Traceroute6

Table 59 Troubleshoot: Connectivity

Parameters	Description	Range	Default
Ping			
IP Address or Hostname	Provide IPv6 address or Hostname to validate the reachability of the destined Host.	-	-
Number of Packets	Provide number of request packets that are required to be transmitted to validate the reachability of destined Host.	1-10	3
Buffer Size	Configure ICMP packet size.	1-65507	56
Ping Result	Displays the ICMP results.	-	-
DNS Lookup			

Parameters	Description	Range	Default
Host Name	Provide Hostname whose IPv6 must be resolved.	-	-
DNS Test Result	Displays the IP's that are associated with configured Hostname.	-	-
Traceroute			
IP Address or Hostname	Provide IPv6 address or Hostname to validate the reachability of the destined Host.	-	-
Fragmentation	Provision to allow or deny fragment packets.	-	Off
Trace Method	Provision to configure payload mechanism to check the reachability of destined IPv6/Hostname.	-	ICMP Echo
Display TTL	Provision to customize TTL display.	-	On
Verbose	Provision to display the output of traceroute.	-	On
Traceroute Result	Displays the output of traceroute command.	-	-

To configure the above parameter, navigate to the **Troubleshoot > Connectivity** tab and provide the details as given below:

To configure **Ping6**:

6. Select **Test type** from the drop-down list.
7. Enter **IPv6 address or Hostname** in the textbox.
8. Enter the **Number of packets** in the textbox.
9. Select **Buffer Size** value from the drop-down list.
10. Start **Ping6**.

To configure **DNS Lookup6**:

3. Enter the **Hostname** in the textbox.
4. Click **DNS Test**.

To configure **Traceroute6**:

7. Enter **IPv6 address or Hostname** in the textbox.
8. Click **Fragmentation** to **ON/Off**.
9. Select **Trace Method** to either **ICMP Echo/UDP**.
10. Click **Display TTL** to **ON/Off**.
11. Click **Verbose** to **ON/Off**.
12. Click **Start Traceroute**.

Chapter 13: Management Access

This chapter describes different methods of authenticating users to access device UI. Following are the authentication methods supported by cnPilot devices:

- **Local authentication**
- **SSH-Key authentication**
- **RADIUS authentication**

Local authentication

This is the default authentication mode enabled on device. Only one username is supported which is “admin”. Default password for “admin” username is “admin”. User has provision to configure/update password.

Device configuration

Figure 67 shows how to configure/update default password of admin user.

1. Under Management, enter **Admin Password**.
2. Click **Save**.

Figure 70 configure/update default password of admin user

The screenshot displays the configuration page for a Cambium Networks cnPilot E400 - E400-AFA308 device. The interface is divided into two main sections: System and Management.

System Configuration:

- Name:** E400-AFA308 (Hostname of the device (max 64 characters))
- Location:** (Location where this device is placed (max 64 characters))
- Contact:** (Contact information for the device (max 64 characters))
- Country-Code:** India (For appropriate regulatory configuration)
- Placement:** Indoor (selected), Outdoor (Configure the AP placement details)
- LED:** Whether the device LEDs should be ON during operation
- LLDP:** Whether the AP should transmit LLDP packets

Management Configuration:

- Admin Password:** (Configure password for authentication of GUI and CLI sessions)
- Autopilot:** Default (Autopilot Management of APs)
- Teinet:** Enable Teinet access to the device CLI
- SSH:** Enable SSH access to the device CLI
- SSH Key:** (Use SSH keys instead of password for authentication)
- HTTP:** Enable HTTP access to the device GUI
- HTTP Port:** 80 (Port No for HTTP access to the device GUI(1-65535))

SSH-Key authentication

SSH keys are also used to connect remote machines securely. They are based on the SSH cryptographic network protocol, which is responsible for the encryption of the information stream between two machines. Ultimately, using SSH keys user can connect to remote devices without even entering a password and much more securely too. SSH works based on “public-key cryptography”. For simplicity, let us consider that SSH keys come in pairs. There is a **private key**, that is safely stored to the home

machine of the user and a **public key**, which is stored to any remote machine (AP) the user wants to connect. So, whenever a user initiates an SSH connection with a remote machine, SSH first checks if the user has a private key that matches any of the public keys in the remote machine and if not, it prompts the user for password.

Device configuration

SSH Key based access method can be configured on device using standalone AP or from cnMaestro. Navigate to **System > Management** and configure the following:

1. Enable **SSH** checkbox.
2. Provide Public key generated from steps described in **SSH Key Generation** section.

Figure 71 System > Management

The screenshot shows the configuration interface for a Cambium Networks cnPilot E400 - E400-AFA308 device. The left sidebar contains navigation options: Dashboard, Monitor, Configure, System (selected), Radio, WLAN, Network, Services, Operations, and Troubleshoot. The main content area is divided into two sections: System and Management.

System Section:

- Name:** E400-AFA308 (Hostname of the device (max 64 characters))
- Location:** (Location where this device is placed (max 64 characters))
- Contact:** (Contact information for the device (max 64 characters))
- Country-Code:** India (For appropriate regulatory configuration)
- Placement:** Indoor (selected) / Outdoor (Configure the AP placement details)
- LED:** Whether the device LEDs should be ON during operation
- LLDP:** Whether the AP should transmit LLDP packets

Management Section:

- Admin Password:** (Configure password for authentication of GUI and CLI sessions)
- Autopilot:** Default (Autopilot Management of APs)
- Telnet:** Enable Telnet access to the device CLI
- SSH:** Enable SSH access to the device CLI
- SSH Key:** (Use SSH keys instead of password for authentication)
- HTTP:** Enable HTTP access to the device GUI
- HTTP Port:** 80 (Port No for HTTP access to the device GUI(1-65535))
- HTTPS:** Enable HTTPS access to the device GUI
- HTTPS Port:** 443 (Port No for HTTPS access to the device GUI(1-65535))

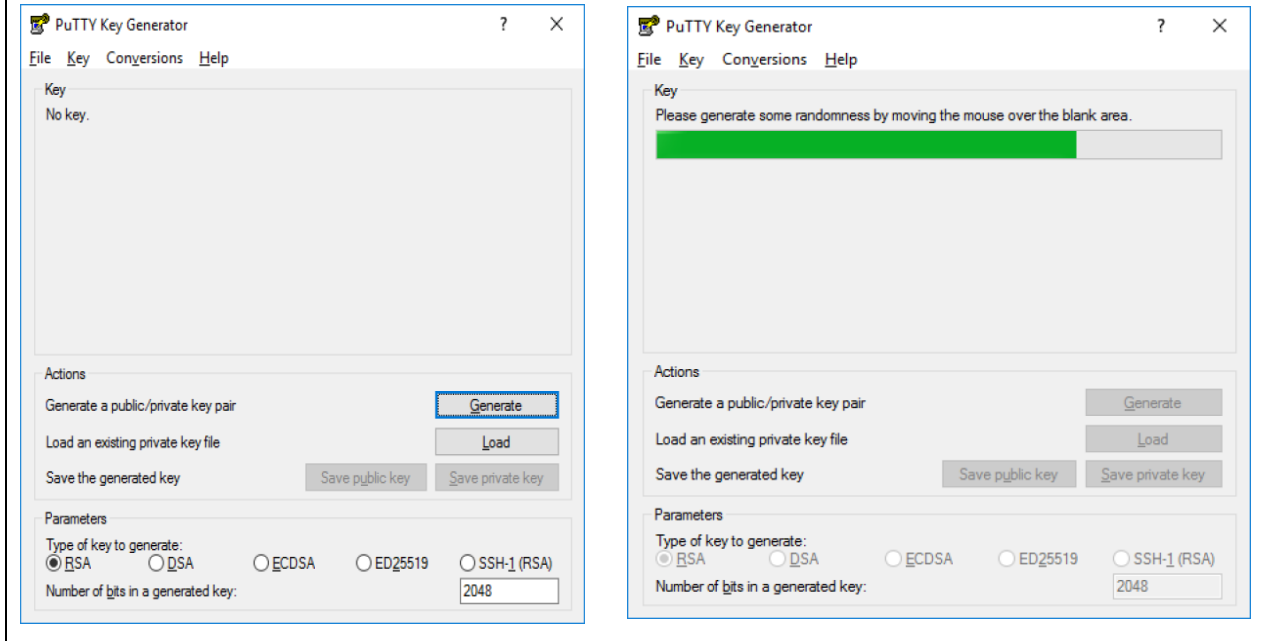

SSH Key Generation

Windows

PUTTY tool can be used to generate both Public and Private Key. Below is a sample demonstration of configuring cnPilot device and logging using SSH Key via UI.

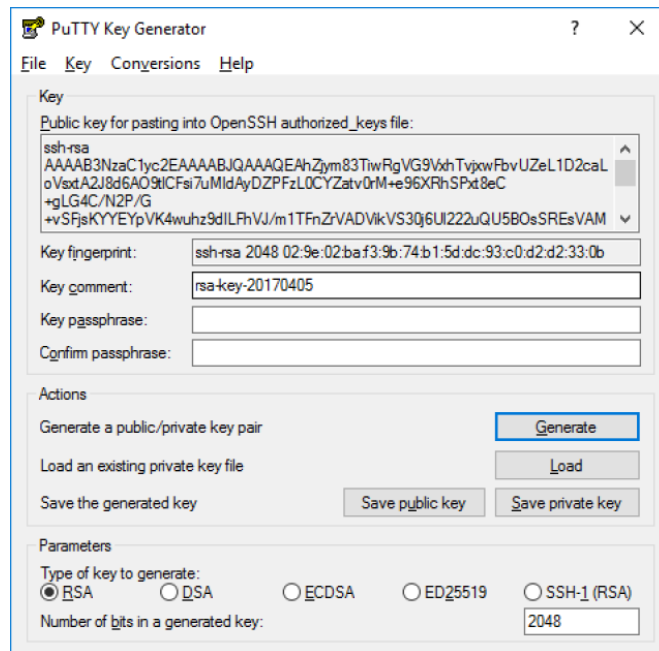

1. Generate a key pair in PUTTY Key Generator (**Figure 72**) and save private and public key as shown in **Figure 73**.

Figure 72 Generating public/private Key

2. Save the Public key and Private key once key pair is generated as shown in [Figure 73](#).

Figure 73 Public and Private Key

3. Save the Public key generated in step above as described in [Device configuration](#) section.
4. Login to device using Private key generated above with username as “admin”.

Linux

If using a Linux PC and SSH from the Linux host, then you can generate the keys with the following steps:

1. Generate key pair executing below command on Linux console as shown in [Figure 74](#).

Figure 74 Public Key location path

```

saidell@saidell-Vostro-15-3568:~$ ssh-keygen -t rsa
Generating public/private rsa key pair.
Enter file in which to save the key (/home/saidell/.ssh/id_rsa):
Created directory '/home/saidell/.ssh'.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/saidell/.ssh/id_rsa.
Your public key has been saved in /home/saidell/.ssh/id_rsa.pub.
The key fingerprint is:
SHA256:VRR4qleviI2zqqXDFe5FCgR/SwCX7vDfzT65jNbKio8 saidell@saidell-Vostro-15-3568
The key's randomart image is:
+---[RSA 2048]-----+
|
|  . . . . .
|  o. . . +
|  . . . . .o
|  .oo. . .
|  =o.o S.
|  .o . . .
|  .oo..o.= o
|  oo.++B++* .
|  ooE+O**o=+
+---[SHA256]-----+
saidell@saidell-Vostro-15-3568:~$

```

2. The Public key is now located in PATH mentioned in [Figure 71](#).
 - PATH = “Enter the file to which to save the key”
3. The private key (identification) is now saved in PATH as mentioned in [Figure 75](#).
 - PATH = “Your identification has saved in <>”

Figure 75 Private Key saved path

```

saidell@saidell-Vostro-15-3568:~$ cat /home/saidell/.ssh/id_rsa.pub
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQDg/1dsGyP4rFOKH8Uny3HgCHgzLl4quxd2ak2oQ4Us+qGRQLQNB1UD8Jh6ZhpESMcJTa8x1G2g0n33b1WpUlnEtxKY9pvC77ccQYm0u
sLC1lq157svTnBxBYn+78gQ7+AUKG+HFucDmHRH85LucHJJP5XAtcwwLQ8pXmzsTyOJeZmkBmESV08+rFnM4/bIPDdzfp6plc681notZQ3h/FtHU0XLtMOMX3g87vMQQlhy6HtnzYLT2PHV
I9o8A5WwVd1QW0Imbse57z7n6exs+/eQd81FTN+IyEuphxFWZVDEcXlznBFFwSAT8FKCRRQq4MxRnIM43n3V+zhwYH saidell@saidell-Vostro-15-3568
saidell@saidell-Vostro-15-3568:~$

```

4. Save the Public key generated in step above as described in [Device configuration](#) section.
5. Login to device using Private key generated above with username as “admin”.

RADIUS authentication

Device management access using RADIUS authentication allows multiple users to access using unique credentials and is secured.

Device configuration

Management access using RADIUS authentication method can be configured on device using standalone AP or from cnMaestro. Navigate to **System > Management** and configure the following:

1. Enable **RADIUS Mgmt Auth** checkbox.
2. Configure RADIUS IPv4/IPv6/Hostname and shared secret in **RADIUS Server** and **RADIUS Secret** parameters respectively.

3. Click **Save**.

Figure 76 System > Management: RADIUS Server and RADIUS Secret parameters

The screenshot shows the configuration page for a Cambium Networks device (cnPilot E-400 - E400-AFA308). The left sidebar contains navigation options: Dashboard, Monitor, Configure, System (selected), Radio, WLAN, Network, Services, Operations, and Troubleshoot. The main content area is divided into two sections:

- System:**
 - Name: E400-AFA308 (Hostname of the device (max 64 characters))
 - Location: (Location where this device is placed (max 64 characters))
 - Contact: (Contact information for the device (max 64 characters))
 - Country-Code: India (For appropriate regulatory configuration)
 - Placement: Indoor Outdoor (Configure the AP placement details)
 - LED: Whether the device LEDs should be ON during operation
 - LLDP: Whether the AP should transmit LLDP packets
- Management:**
 - Admin Password: (Configure password for authentication of GUI and CLI sessions)
 - Autopilot: Default (Autopilot Management of APs)
 - Telnet: Enable Telnet access to the device CLI
 - SSH: Enable SSH access to the device CLI
 - SSH Key: (Use SSH keys instead of password for authentication)
 - HTTP: Enable HTTP access to the device GUI
 - HTTP Port: 80 (Port No for HTTP access to the device GUI(1-65535))
 - HTTPS: Enable HTTPS access to the device GUI
 - HTTPS Port: 443 (Port No for HTTPS access to the device GUI(1-65535))
 - RADIUS Mgmt Auth: Enable RADIUS authentication of GUI/CLI sessions
 - RADIUS Server: (RADIUS server IP/hostname)
 - RADIUS Secret: (RADIUS server shared secret)

4. Login to device using appropriate credentials as shown in **Figure 77**.

Figure 77 UI Login page

The screenshot shows the login page with a blue header labeled "Login". Below the header are two input fields:

- A username field with a person icon on the left and the text "bob" entered. This field is highlighted with a red border.
- A password field with a lock icon on the left and five dots representing the password.

Below the password field is a blue "Sign In" button.

Chapter 14: Mesh

cnPilot Enterprise series Wi-Fi Aps support wireless mesh allowing the user to easily extend the range of their network and to cover areas where a cable run might be hard to do. Mesh support was added in software version 2.0.

cnPilot devices support mesh connections between radios. Mesh links can form between radios which are operating in the same band. Given the larger set of available channels and typically cleaner RF environment Cambium recommend using the 5GHz radio for mesh backhaul.

For a stable mesh link to be established, cnPilot mesh operates in three modes of operation:

1. Mesh Base (MB)

cnPilot device that operates in MB mode is the key to Mesh topology. MB is usually connected to the wired network. The radio setup for MB will select a channel and start transmitting beacons as soon as the AP comes up.

2. Mesh Client (MC)

cnPilot device that operates in MC mode, scans all available channels supported as per regulatory domain and establishes a link with MB.

3. Mesh Recovery (MR)

This mode when enabled helps to maintain mesh link if there is a disruption in backhaul link established with MB and MC. Mesh link disruption can cause due to PSK mismatch or due to asynchronous configurations on MB and MC. This mode needs to be exclusively enabled on MB device.

This mode can also help in Zero Touch Configuration of cnPilot device.

Mesh configurable parameters

Table 60 lists the configurable parameters that are exclusive to mesh:

Table 60 Configure: WLAN > Mesh parameters

Parameters	Description	Range	Default
Enable	Option to enable a WLAN profile. Once enabled, a Beacon is broadcasted with SSID and respective configured parameters in a WLAN profile.	–	–
Mesh	<p>This parameter is required when a WDS connection is established with cnPilot devices. Four options are available under this parameter:</p> <ol style="list-style-type: none"> Base A WLAN profile configured with mesh-base will operate like a normal AP. Its radio will beacon on startup so its SSID can be seen by radios configured as mesh-clients. Client 	–	Off

Parameters	Description	Range	Default
	<p>A WLAN profile configured with mesh-client will scan all available channels on startup, looking for a mesh-based AP to connect.</p> <p>3. Recovery</p> <p>A WLAN profile configured as mesh-recovery will broadcast pre-configured SSID upon detection of mesh link failure after a successful connection. This needs to be exclusively configured on mesh-base device. Mesh-client will auto scan for mesh-recovery SSID upon failure of mesh link.</p> <p>4. Off</p> <p>Mesh support disable on WLAN profile.</p>		
SSID	SSID is the unique network name to which MC connects and establishes mesh link.	–	–
VLAN	Management VLAN to access all devices in mesh topology.	1-4094	1
Security	<p>This parameter determines key values that is encrypted based on selected algorithm. Following security methods are supported by cnPilot devices:</p> <p>1. Open</p> <p>This method is preferred when Layer 2 authentication is built in the network. With this configured on cnPilot device, any mesh link can be established.</p> <p>2. WPA2-Pre-Shared Keys</p> <p>This mode is supported with AES encryption.</p> <p>3. WPA2 Enterprise</p> <p>This security type uses 802.1x authentication to associate mesh devices. This is a centralized system of authentication method.</p>	–	Open
Passphrase	String that is a key value to generate keys based on security method configured.	–	12345678
Radios	<p>Each SSID can be configured to be transmitted as per the deployment requirement. For a mesh WLAN profile, options available to configure band:</p> <ul style="list-style-type: none"> • 2.4GHz • 5GHz 	–	2.4GHz
Max Clients	This specifies the maximum number of mesh clients that can be associated to a mesh WLAN profile. This varies based on cnPilot device model number. Refer Table 16 for more details.	1-512 (Refer Table 16)	128

Parameters	Description	Range	Default
Client Isolation	<p>This feature needs to be enabled when there is a need for prohibition of inter mesh devices communication either over the network or on an AP. Three options are available to configure based on requirement:</p> <ol style="list-style-type: none"> Disable This option when selected disables client isolation feature. i.e. Inter Mesh client communication is allowed. Local This options when selected enables client isolation feature. This option prevents inter mesh client communications connected to same device. Network Wide This option when selected enables network wide client isolation feature. It prevents mesh client communications connected to different AP deployed in same network. 	–	Disabled
Hide SSID	This is the basic security mode of a Wi-Fi device. This parameter when enabled, will not broadcast SSID.	–	Disabled
Mesh Vlan Tagging	Enable the VLAN tagging over mesh link. This is applicable only for Cambium mesh topology.	–	Enabled
Mesh Auto Detect Backhaul	<ol style="list-style-type: none"> Single Hop MC is configured on MB with same WLAN parameters. When enabled, this feature triggers when a MB losses Ethernet connectivity. MB profile will get disabled and MC profile will get enable and establishes mesh link with nearest MB. For MB profile to get auto disabled, uncheck Mesh Multi Hop. Multi Hop MC is configured on MB with same WLAN parameters. When enabled, this feature triggers when a MB losses Ethernet connectivity. MB profile and MC profile will get enable and establishes mesh link with nearest MB. 	–	Disabled
Drop Multicast Traffic	When enabled, will drop all multicast flowing in or out of that WLAN.	–	Disabled
Insert DHCP Option 82	<p>Enabling this option appends Option 82 in the DHCP packets. Following information is allowed to configure:</p> <ol style="list-style-type: none"> DHCP Option 82 Circuit ID Configurable parameters under this option are as follows: <ul style="list-style-type: none"> • Hostname 		Disabled

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> • APMAC • Site ID • BSSID • SSID • Custom <p>2. DHCP Option 82 Remote ID</p> <p>Configurable parameters under this option are as follows:</p> <ul style="list-style-type: none"> • Hostname • APMAC • Site ID • BSSID • SSID • Custom 		
Tunnel Mode	This option is enabled when user traffic is tunneled to central network either using L2TP or L2GRE.	–	Disabled
Mesh Monitored Host	This parameter is exclusive to MC device. Configure IP or Hostname to check the link status.	–	–
Mesh Monitor Duration	Configure the interval at which the ping is sent for the configured mesh monitored host.	5-60 Min	30
Mesh Recovery Interval	Configure the interval for the consecutive ping loss seen after which the mesh link is considered to be down and a reconnect is attempted. One can configure the duration and interval both to be the same at which case the first ping loss itself will result in triggering the reconnect.	5-30 Min	30

To configure the above parameters, navigate to the **Configure > WLAN > Basic** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable the operations of this WLAN.
2. Select the operating parameters **Base/Client/Recovery** from the **Mesh** drop-down list.
3. Enter a name that uniquely identifies a wireless network in the **SSID** textbox.
4. Enter the **VLAN** parameter value in the textbox.
5. Select **Security** type from the drop-down list.
6. Enter WPA2 Pre-shared security passphrase or key in the **Passphrase** textbox.
7. Select the radio type (2.4GHz, 5GHz) on which the WLAN should be supported from the **Radios** drop-down list.
8. Select **Max Clients** parameter value from the drop-down list.

9. Select the required **Client Isolation** parameter from the drop-down list.
10. Enable **Hide SSID** checkbox.
11. Enable **Mesh Vlan Tagging** checkbox.
12. Enable **Mesh Auto Detect Backhaul** checkbox.
13. Enable **Drop Multicast Traffic** checkbox.
14. Enable **Insert DHCP Option 82** checkbox.
15. Select **Tunnel Mode** checkbox to enable tunnelling of WLAN traffic over configured tunnel.
16. Enter the IP or hostname name in the **Mesh Monitored Host** textbox.
17. Select the **Mesh monitor duration** time from the drop-down list.
18. Select the **Mesh recovery interval** time from the drop-down list.
19. Click **Save**.

Figure 78 Configure > Mesh > Base parameters

The screenshot shows the configuration interface for Mesh Base parameters. It is divided into two sections: Basic and Advanced. The Basic section contains the following fields and options:

- Enable:**
- Mesh:** A dropdown menu with 'Base' selected and highlighted by a red box. Description: *Mesh Base/Client/Recovery mode*
- SSID:** Text input field containing 'TEST_SMOKE_8'. Description: *The SSID of this WLAN (upto 32 characters)*
- VLAN:** Text input field containing '1'. Description: *Default VLAN assigned to clients on this WLAN. (1-4094)*
- Security:** Dropdown menu with 'WPA2 Pre-shared Keys' selected. Description: *Set Authentication and encryption type*
- Passphrase:** Text input field containing '.....'. Description: *WPA2 Pre-shared Security passphrase or key*
- Radios:** Dropdown menu with '5GHz' selected. Description: *Define radio types (2.4GHz, 5GHz) on which this WLAN should be supported*
- Max Clients:** Text input field containing '5'. Description: *Default maximum Client assigned to this WLAN. (1-256)*
- Client Isolation:** Dropdown menu with 'Disable' selected. Description: *When selected, it allows wireless clients connected to the same AP or different APs to communicate with each other in the same VLAN*
- Hide SSID:** Do not broadcast SSID in beacons
- Mesh Vlan Tagging:** Enable the vlan tagging over mesh link
- Mesh Auto Detect Backhaul:** Enable the ethernet link status detection and try to connect over mesh link
- Drop Multicast Traffic:** Drop the send/receive of multicast traffic

The Advanced section contains the following options:

- Insert DHCP Option 82:** Enable DHCP Option 82
- Tunnel Mode:** Enable tunnelling of WLAN traffic over configured tunnel

At the bottom of the form are 'Save' and 'Cancel' buttons.

Figure 79 Configure > Mesh > Client parameters

Basic

Enable	<input checked="" type="checkbox"/>	
Mesh	<div style="border: 1px solid red; padding: 2px;">Client</div>	<i>Mesh Base/Client/Recovery mode</i>
SSID	TEST_SMOKE_8	<i>The SSID of this WLAN (upto 32 characters)</i>
VLAN	1	<i>Default VLAN assigned to clients on this WLAN. (1-4094)</i>
Security	WPA2 Pre-shared Keys	<i>Set Authentication and encryption type</i>
Passphrase	<i>WPA2 Pre-shared Security passphrase or key</i>
Radios	5GHz	<i>Define radio types (2.4GHz, 5GHz) on which this WLAN should be supported</i>
Mesh Vlan Tagging	<input checked="" type="checkbox"/>	<i>Enable the vlan tagging over mesh link</i>

Advanced

Mesh Monitored Host	<input type="text"/>	<i>IP or hostname that if not reachable a mesh recovery is attempted</i>
Mesh monitor duration	30	<i>Duration in minutes (5-60)</i>
Mesh recovery interval	30	<i>Interval in minutes after which a full recovery is attempted if the mesh base is not reachable (5-30)</i>

Mesh link

This section briefs about configuration of device to get mesh link established with different deployment scenarios.

Order of Mesh profile configuration

If a device is configured as mesh base/client/recovery, recommended order of WLAN configuration should be as follows:

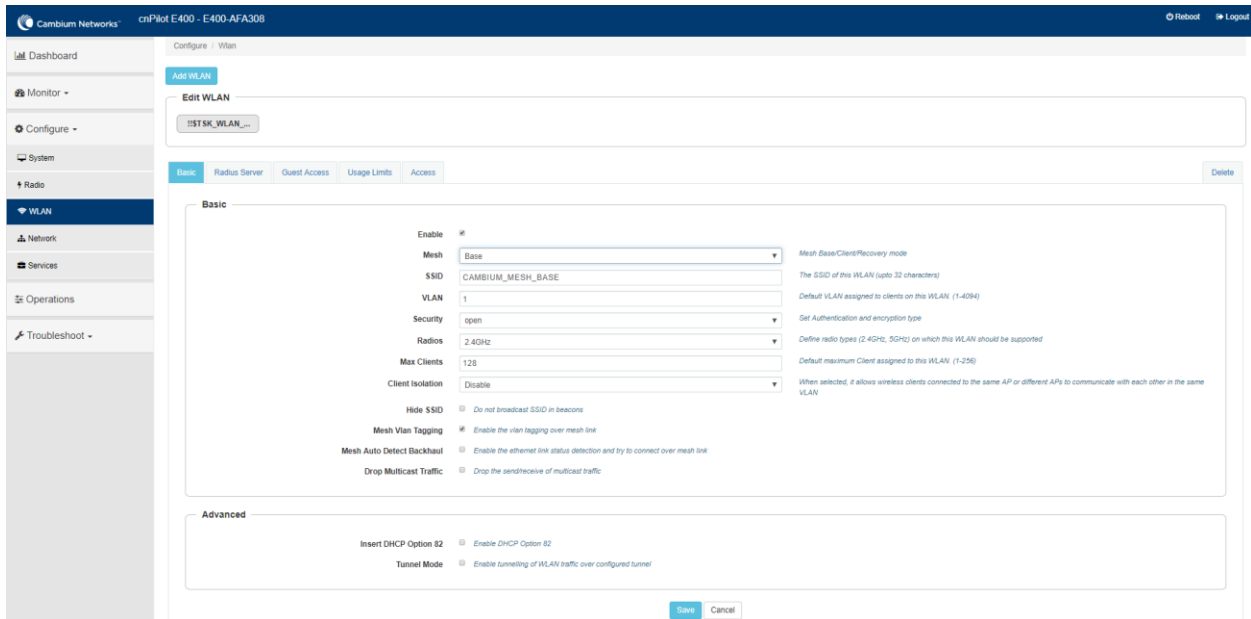

- WLAN profile 1: Mesh client
- WLAN profile 2: Mesh base
- WLAN profile 3: Mesh recovery

VLAN 1 as management interface

Follow the below steps to establish mesh link with VLAN 1 as management interface:

1. On MB, configure MB and MR. Follow the below steps to configure MB:
 - a. WLAN profile

Figure 80 Mesh Base configuration with native VLAN 1

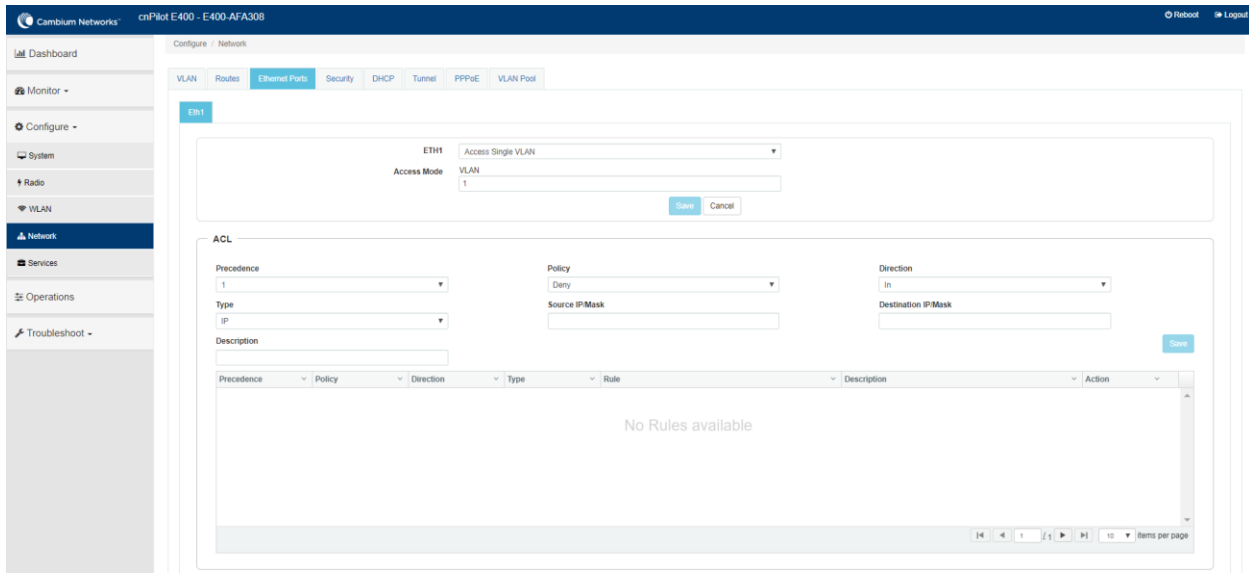

b. Management VLAN interface

Figure 81 Mesh Base configuration > Management VLAN 1

c. Ethernet interface

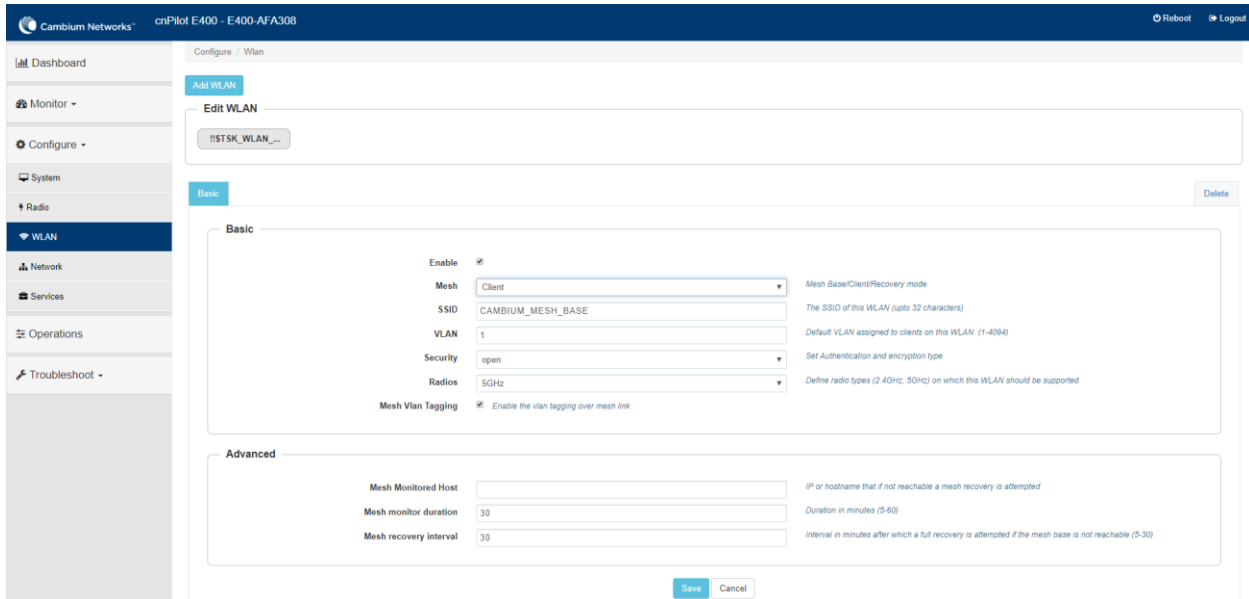

Figure 82 Mesh Base Ethernet configuration > Access VLAN 1

2. Configure MC as below:

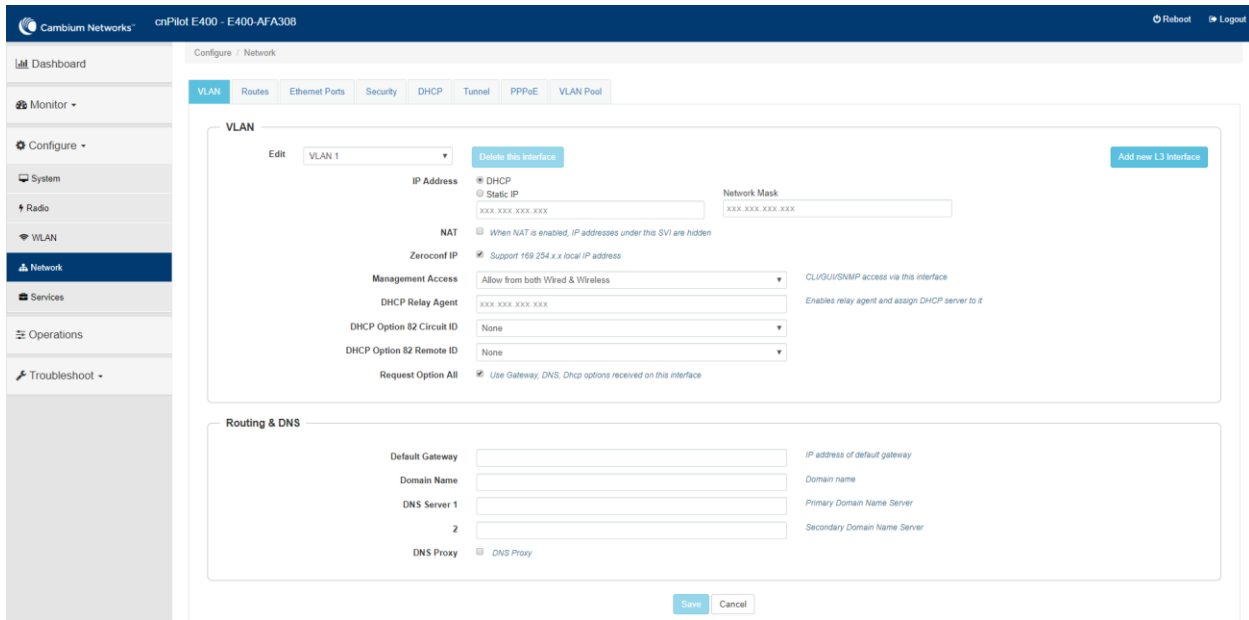

a. WLAN profile

Figure 83 Mesh Client configuration with VLAN 1

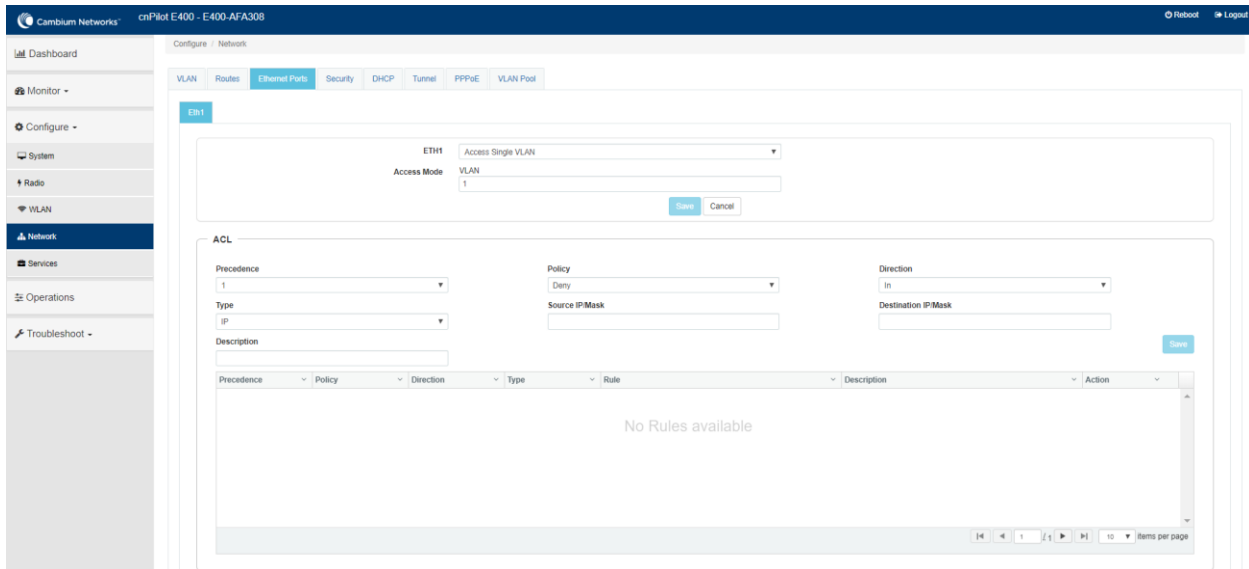

b. Management interface

Figure 84 Mesh Client configuration > Management VLAN 1

c. Ethernet interface

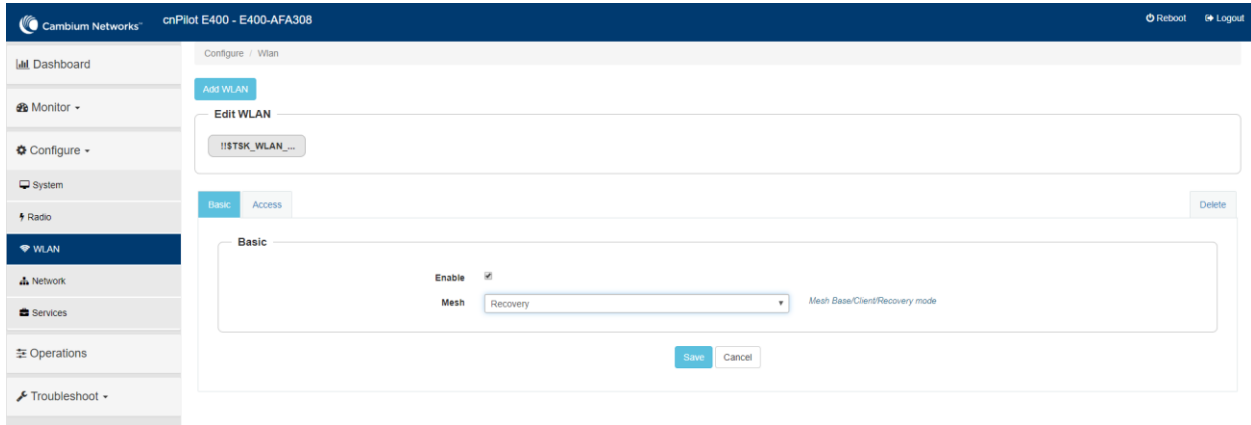

Figure 85 Mesh Client Ethernet configuration > Access VLAN 1

3. Configure MR on MB device as follows on any WLAN profile:

a. WLAN profile

Figure 86 Configure > WLAN > Mesh Recovery

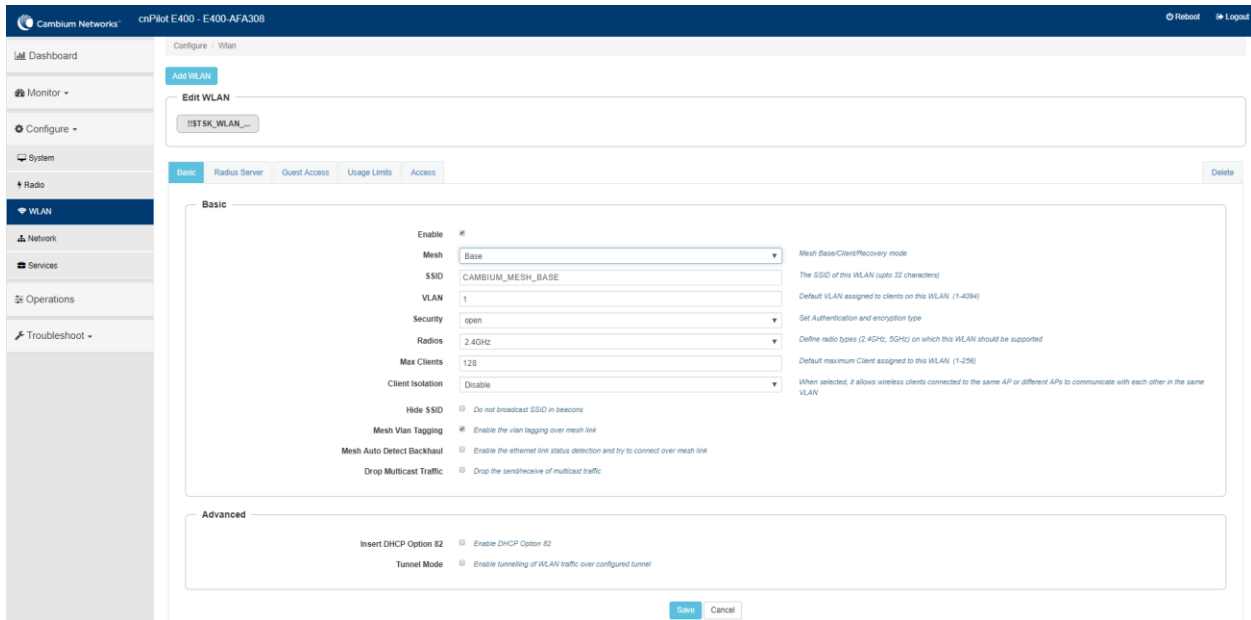

Non-VLAN 1 as management interface

Follow the below steps to establish mesh link with Non-VLAN 1 as management interface:

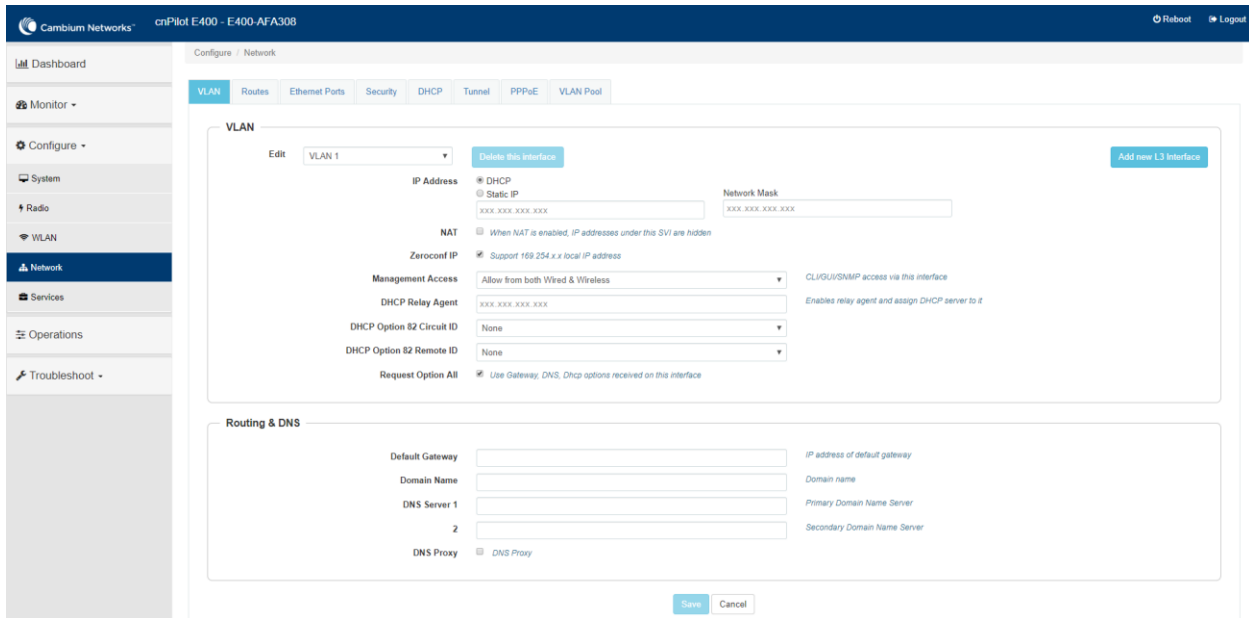

1. On MB, configure MB and MR. Following are the steps to configure MB:
 - a. WLAN profile

Figure 87 Mesh Base configuration with non-VLAN 1

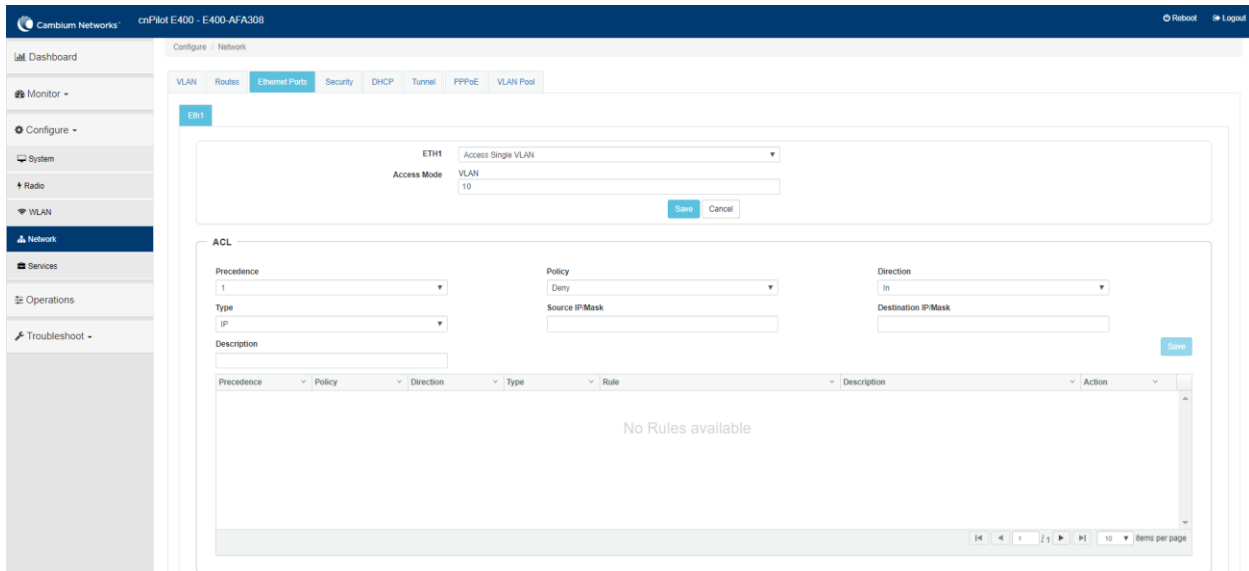

- b. Management VLAN interface

Figure 88 Mesh Base configuration > Management non-VLAN 1

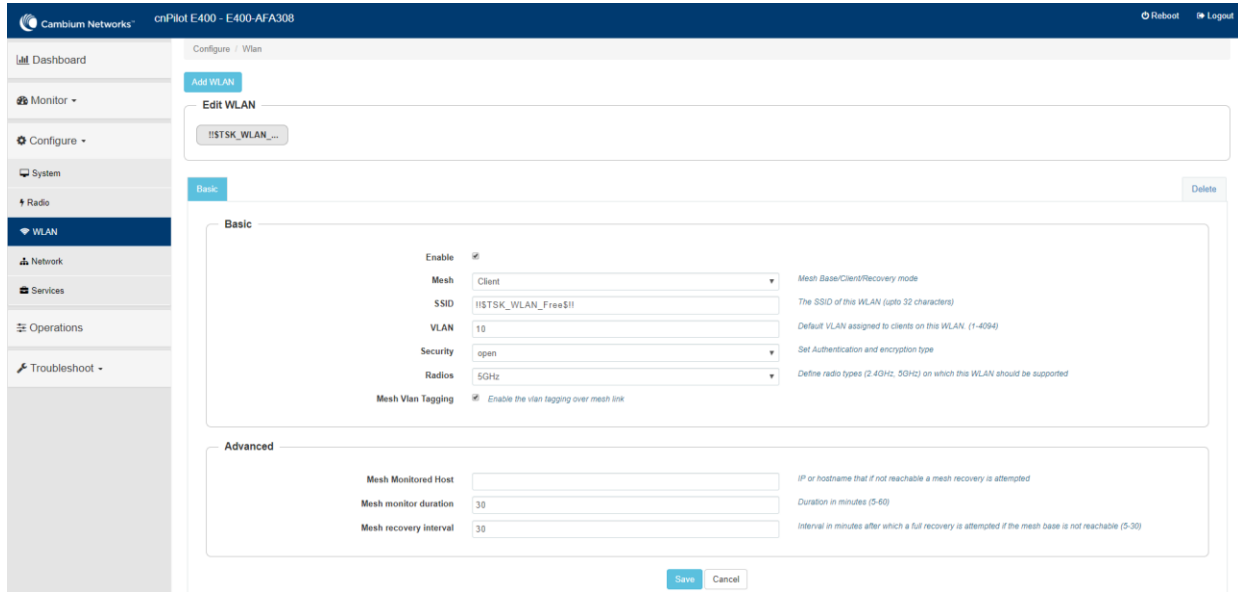

c. Ethernet interface

Figure 89 Mesh Base Ethernet configuration > Access non-VLAN 1

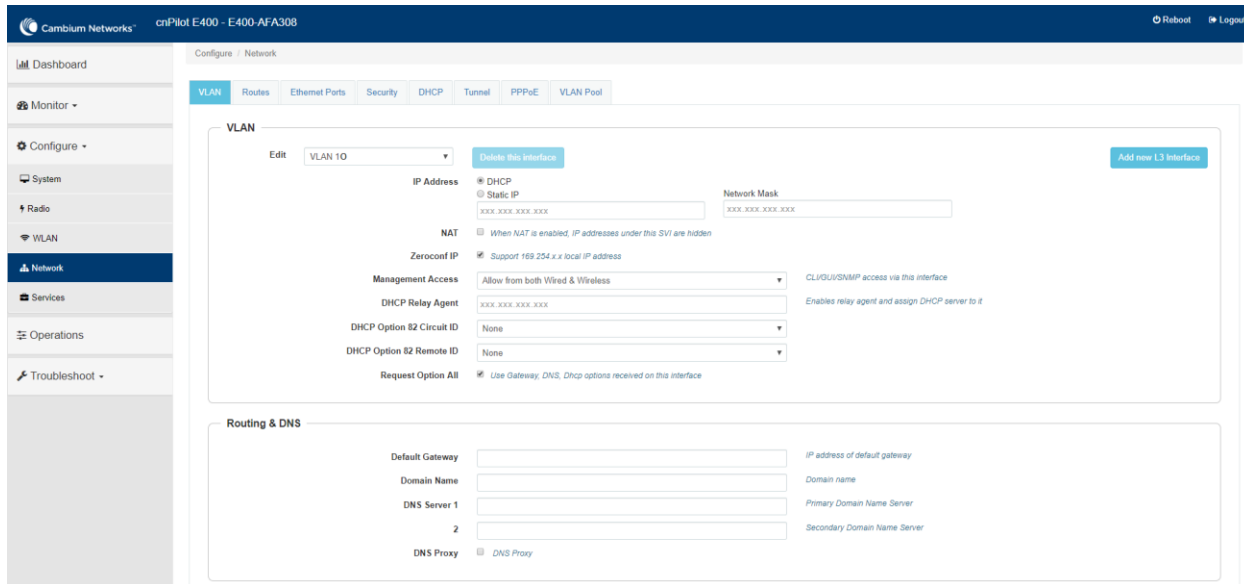

2. Configure MC as below:
 - a. WLAN profile

Figure 90 Mesh Client configuration with non-VLAN 1

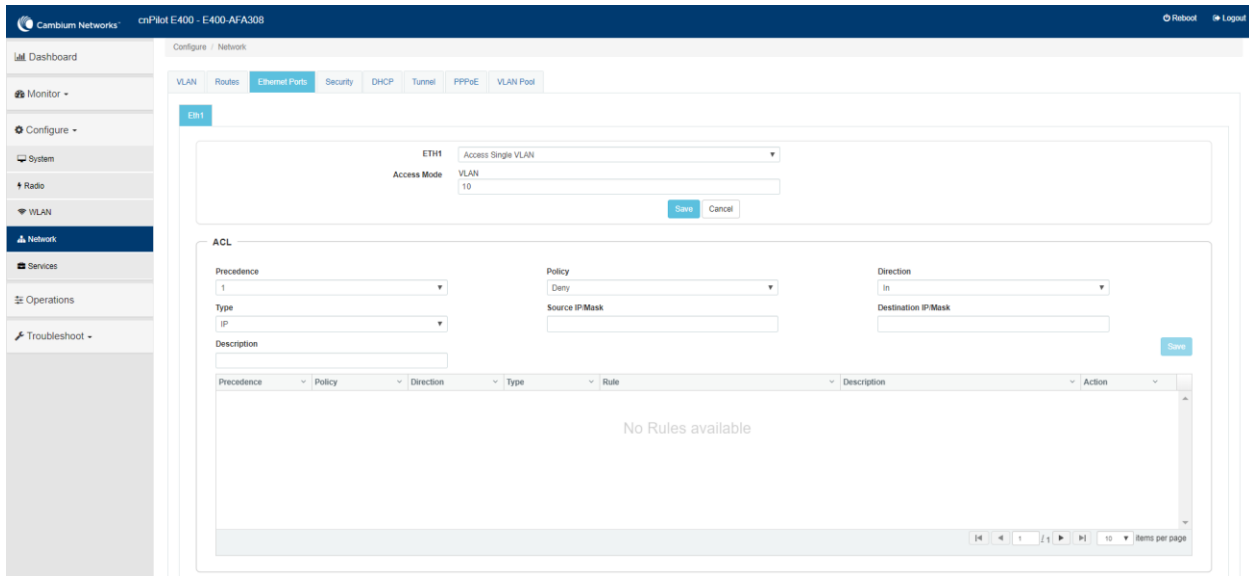

b. Management interface

Figure 91 Mesh Client configuration > Management non-VLAN 1

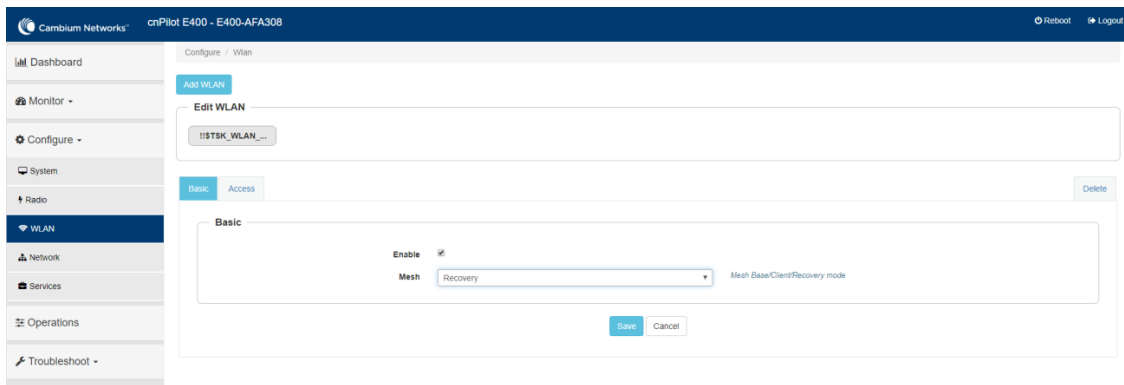

c. Ethernet interface

Figure 92 Mesh Client Ethernet configuration > Access non-VLAN 1

3. Configure MR on MB device on any WLAN profile as follows:
 - a. WLAN profile

Figure 93 Configure > WLAN > Mesh Recovery

Chapter 15: Autopilot

Autopilot is a feature on Cambium Enterprise Wi-Fi APs that allows one AP to be a controller of other APs in a network to manage:

- [Configuration and Onboarding](#)
- [Manage Autopilot](#)
- [Dashboard](#)
- [Insight](#)

Configuration and Onboarding

This section provides required information to:

- [Configure member AP to Autopilot master](#)
- [Configuring WLAN in default WLAN Group](#)
- [Configuring WLANs with user created WLAN Group](#)
- [WLAN group override](#)
- [Configuring WPA2-Enterprise WLAN](#)
- [Onboard member APs to Autopilot master](#)
- [Connect clients to the WLANs and check statistics](#)

Configure member AP to Autopilot master

To configure member APs to a Master:

1. Open a web browser and browse the IP address of an AP in the network and access the AP's UI page.

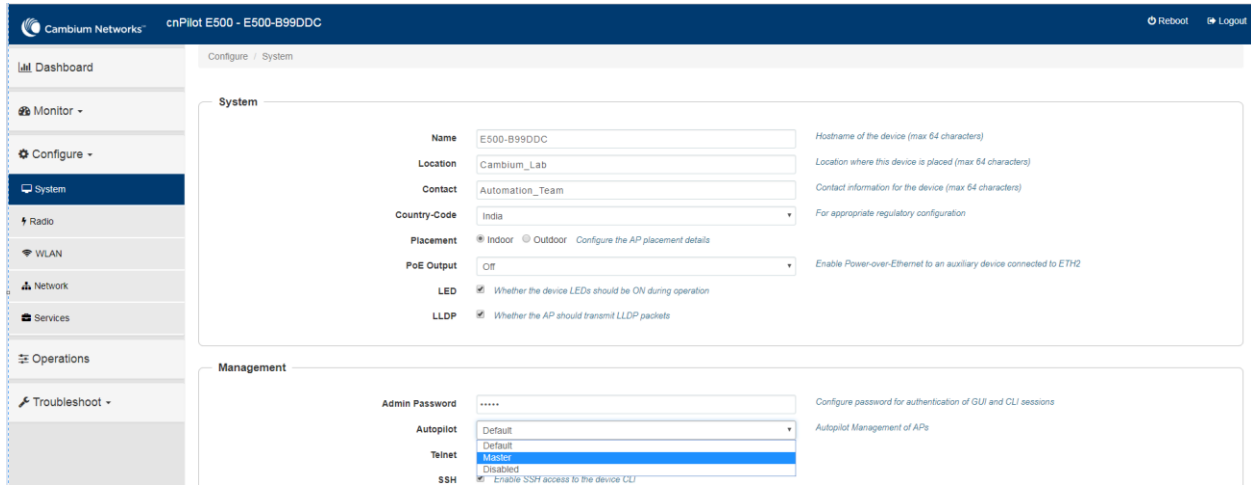

Note

The AP needs to be upgraded with autopilot firmware.

2. Go to **Configure > System > Management > Autopilot** and select the AP as Master.

Figure 94 Configure > System > Management > Autopilot

3. Click **Save**.
4. Refresh the web page and AP brings up the Autopilot UI.

The configured Master AP can perform the following:

- Act as a controller and manage other member APs
- Configure approved APs
- Upgrade firmware
- Display combined statistics and events

Cambium Enterprise AP can be configured the following ways:

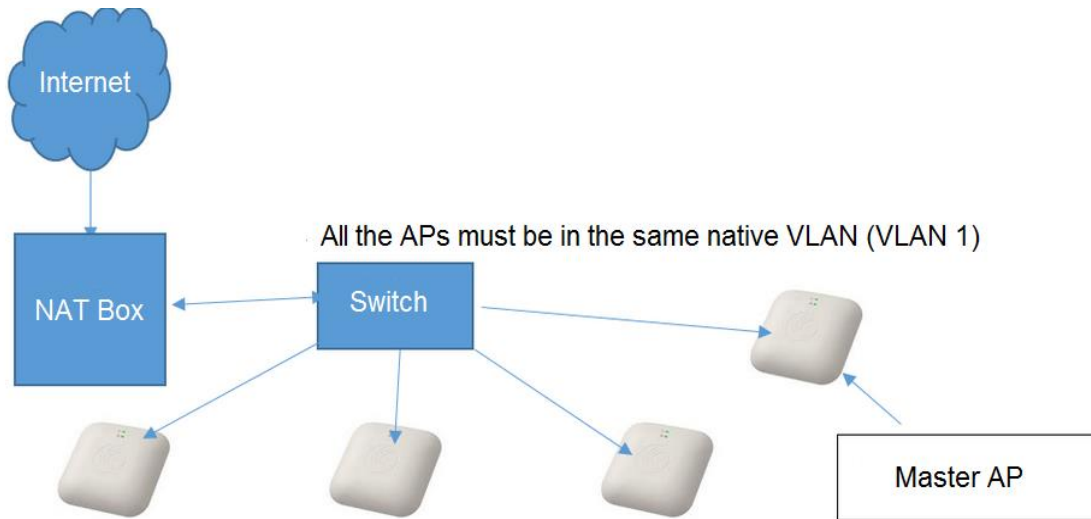

- **Configuring an AP with Internal DHCP server**
- **Configuring an AP with External DHCP Server**

Configuring an AP with Internal DHCP server

Network Topology

The initial network for installments with external NAT device and VLAN segregation (having two VLANs for the network) is shown in **Figure 95**.

Figure 95 Configuring an AP with Internal DHCP server

Configure an AP with default WLAN group

To configure an AP with default WLAN group:

1. Connect all the APs to the native VLAN; for example, VLAN 1 as shown above.
2. Configure all the ports of the switch as trunk with the native VLAN 1 where,
 - a. Allowed VLAN: 10, 20
 - b. Native VLAN: 1

To configure the Master AP:

1. Go to **CONFIGURE > System** and configure **Country Code** and **NTP Servers**.

Figure 96 Configure > Systems

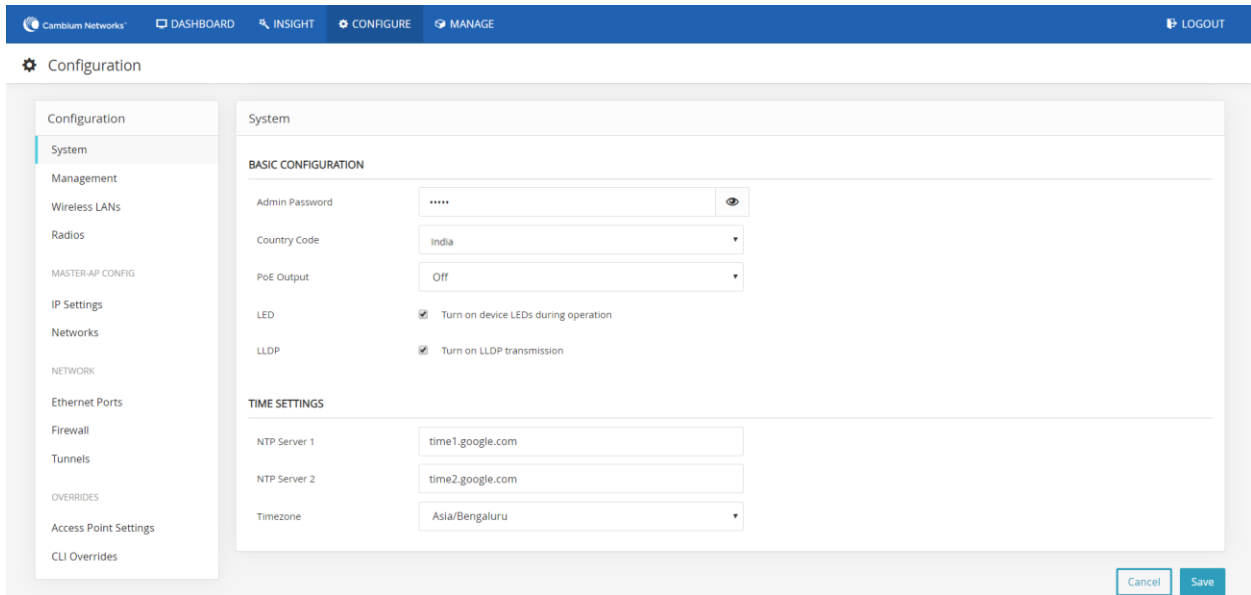

Figure 97 Configure > Ethernet Ports

The screenshot displays the 'Configure > Ethernet Ports' page in the cnPilot Enterprise AP web interface. The top navigation bar includes 'Cambium Networks', 'DASHBOARD', 'INSIGHT', 'CONFIGURE', 'MANAGE', and 'LOGOUT'. The left sidebar shows a navigation menu with categories: Configuration, System, Management, Wireless LANs, Radios, MASTER-AP CONFIG, IP Settings, Networks, NETWORK, Ethernet Ports (highlighted), Firewall, Tunnels, OVERRIDES, Access Point Settings, and CLI Overrides. The main content area is titled 'Ethernet Ports' and contains a 'PORT CONFIGURATION' section. This section has two tabs: 'ETH 1' (selected) and 'ETH 2'. The configuration fields for ETH 1 are: Port Mode (Trunk - Multiple VLANs), Native VLAN (1), Allowed VLANs (1,15,25,50), Native Tagged (checkbox checked, labeled 'Native VLAN tagged'), Port Speed (Auto), and Port Duplex (Full Duplex). At the bottom right of the configuration area are 'Cancel' and 'Save' buttons.

2. Go to **CONFIGURE > MASTER AP CONFIG > Networks** and configure the **Static IP Address** and the **DHCP Server** for VLAN 1 (native VLAN).
3. Enable DHCP Server and provide range of IP addresses. For example, when starting address range is give as 10.10.10.20 to 10.10.10.200, IP addresses can be assigned from 10.10.10.20 to 10.10.10.200 range.

Figure 98 Configure > Networks

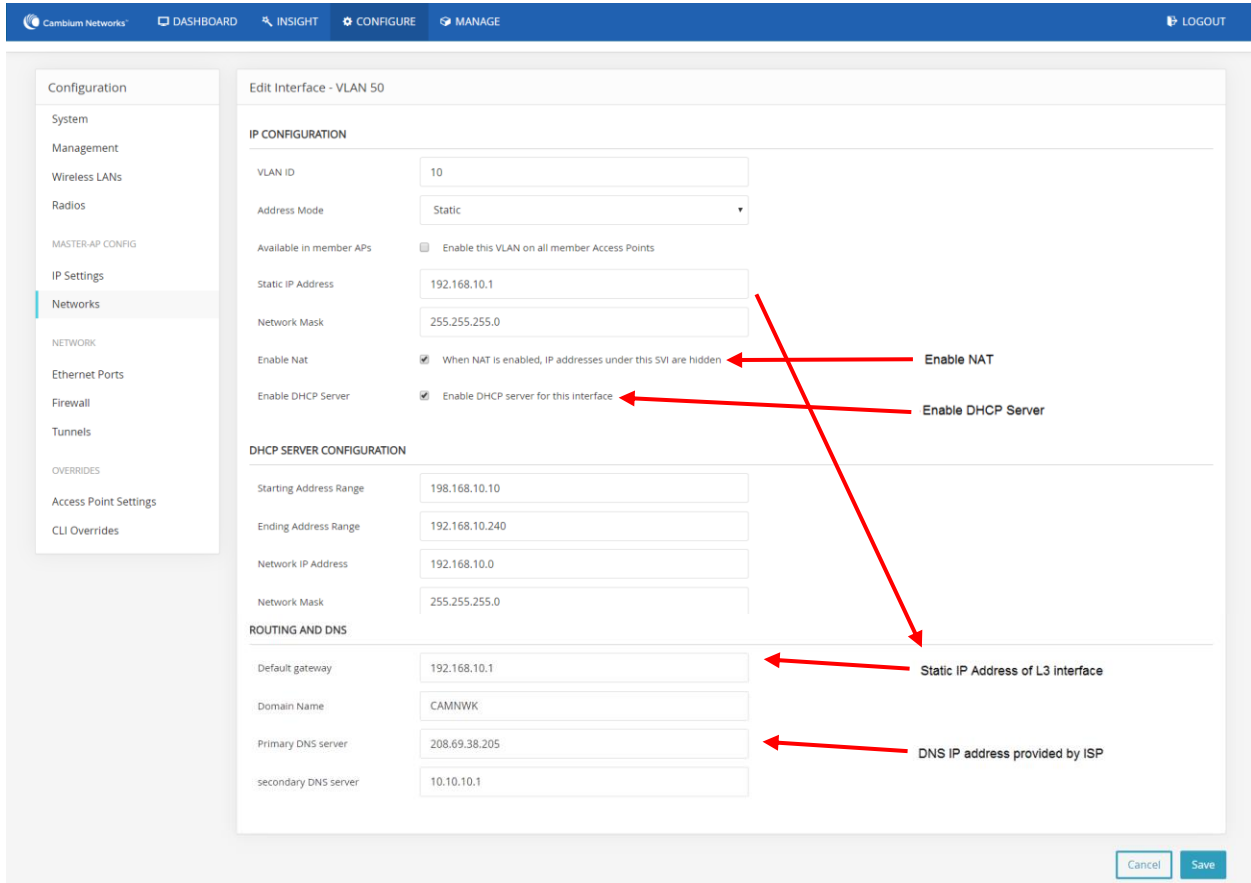

The screenshot shows the 'Edit Interface - VLAN 50' configuration page. The left sidebar contains a navigation menu with categories like Configuration, System, Management, Wireless LANs, Radios, MASTER-AP CONFIG, IP Settings, Networks, NETWORK, Ethernet Ports, Firewall, Tunnels, OVERRIDES, Access Point Settings, and CLI Overrides. The main content area is titled 'Edit Interface - VLAN 50' and contains the following configuration sections:

- IP CONFIGURATION:**
 - VLAN ID: 10
 - Address Mode: Static
 - Available in member APs: Enable this VLAN on all member Access Points
 - Static IP Address: 10.10.10.10
 - Network Mask: 255.255.255.0
 - Enable Nat: When NAT is enabled, IP addresses under this SVI are hidden
 - Enable DHCP Server: Enable DHCP server for this interface
- DHCP SERVER CONFIGURATION:**
 - Starting Address Range: 10.10.10.20
 - Ending Address Range: 10.10.10.200
 - Network IP Address: 10.10.10.0
 - Network Mask: 255.255.255.0
- ROUTING AND DNS:**
 - Default gateway: 10.10.10.1
 - Domain Name: CAMNWK
 - Primary DNS server: 208.69.38.205
 - secondary DNS server: 4.2.2.2

Annotations in the image include a red arrow pointing to the 'Enable DHCP server for this interface' checkbox with the text 'Enable this option to configure DHCP', a red arrow pointing to the 'Default gateway' field with the text 'This should be the IP address of NAT device in your network', and two red arrows pointing to the 'Primary DNS server' and 'secondary DNS server' fields with the text 'Edit these fields as per the DNS server of ISP'. 'Cancel' and 'Save' buttons are located at the bottom right of the configuration area.

4. DHCP pool is used to provide IP addresses to all devices on VLAN 1. Add L3 interface of VLAN 10 and 20 under **CONFIGURE > Networks**.
 - a. Enable **NAT** in this L3 interface.
 - b. Enable **DHCP server** for this VLAN L3 interface.
 - c. Default gateway needs to be Static IP Address of the L3 interface.

Figure 99 Configure > Networks > VLAN 10

5. Add L3 interface of VLAN 20 and enable DHCP server and NAT as shown in Figure 100.

Figure 100 Configure > Networks > VLAN 20

The screenshot shows the 'Edit Interface - VLAN 50' configuration page. The left sidebar contains a navigation menu with categories like Configuration, System, Management, Wireless LANs, Radios, MASTER-AP CONFIG, IP Settings, Networks (highlighted), NETWORK, Ethernet Ports, Firewall, Tunnels, OVERRIDES, Access Point Settings, and CLI Overrides. The main content area is titled 'Edit Interface - VLAN 50' and is divided into three sections:

- IP CONFIGURATION:**
 - VLAN ID: 20
 - Address Mode: Static
 - Available in member APs: Enable this VLAN on all member Access Points
 - Static IP Address: 192.168.20.1
 - Network Mask: 255.255.255.0
 - Enable Nat: When NAT is enabled, IP addresses under this SVI are hidden
 - Enable DHCP Server: Enable DHCP server for this interface
- DHCP SERVER CONFIGURATION:**
 - Starting Address Range: 198.168.20.10
 - Ending Address Range: 192.168.20.200
 - Network IP Address: 192.168.20.0
 - Network Mask: 255.255.255.0
- ROUTING AND DNS:**
 - Default gateway: 192.168.20.1
 - Domain Name: CAMNWK
 - Primary DNS server: 208.69.38.205
 - secondary DNS server: 4.2.2.2

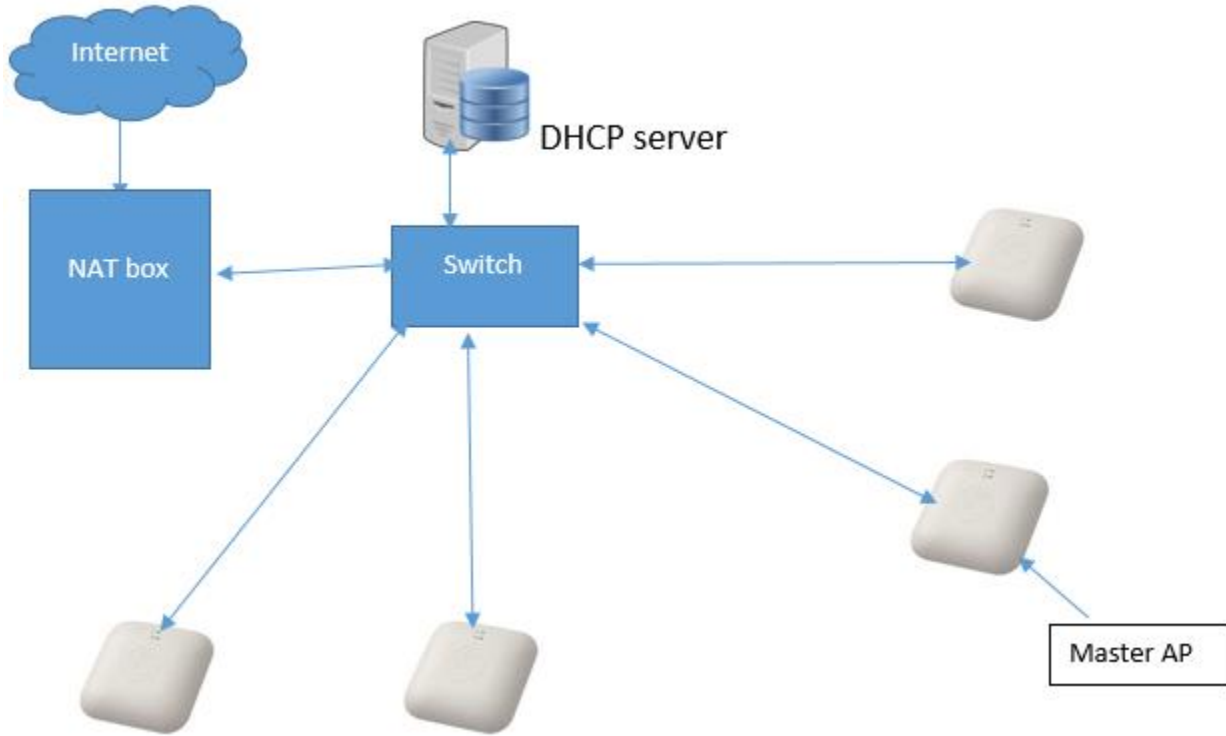

At the bottom right of the configuration area, there are 'Cancel' and 'Save' buttons.

Configuring an AP with External DHCP Server

Network Topology

Initial network installments with external DHCP server and NAT box. The complete network is connected to VLAN 1.

Figure 101 Configuring an AP with External DHCP server

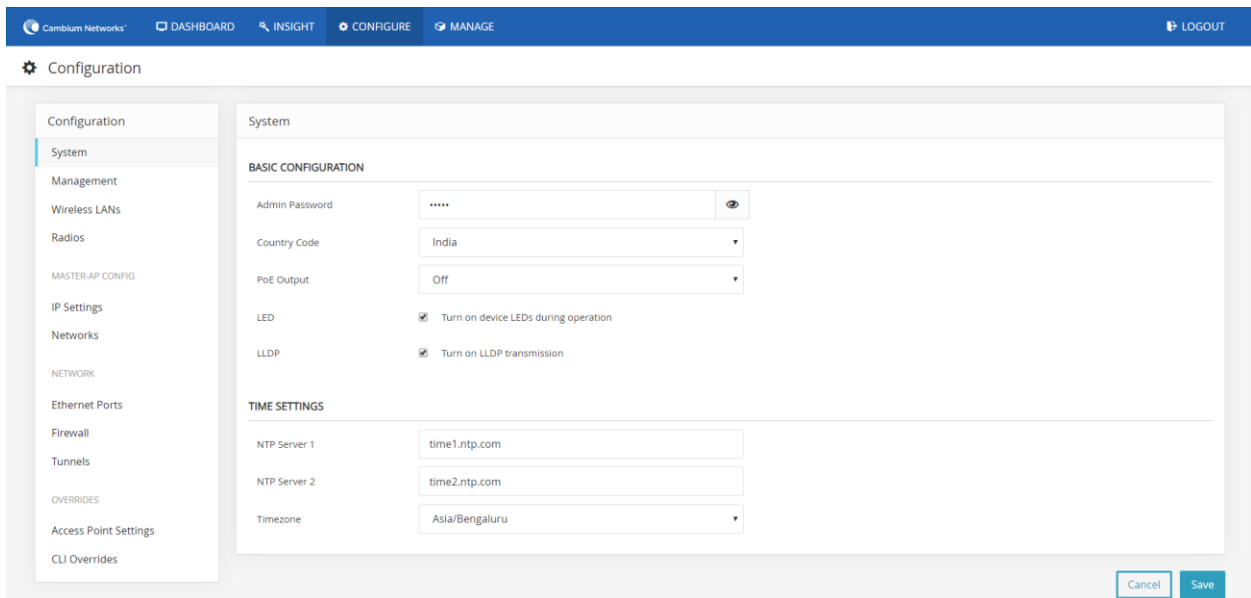

All the member APs are connected to ports of Switch. All the ports are mapped to VLAN 1.

To configure Master AP:

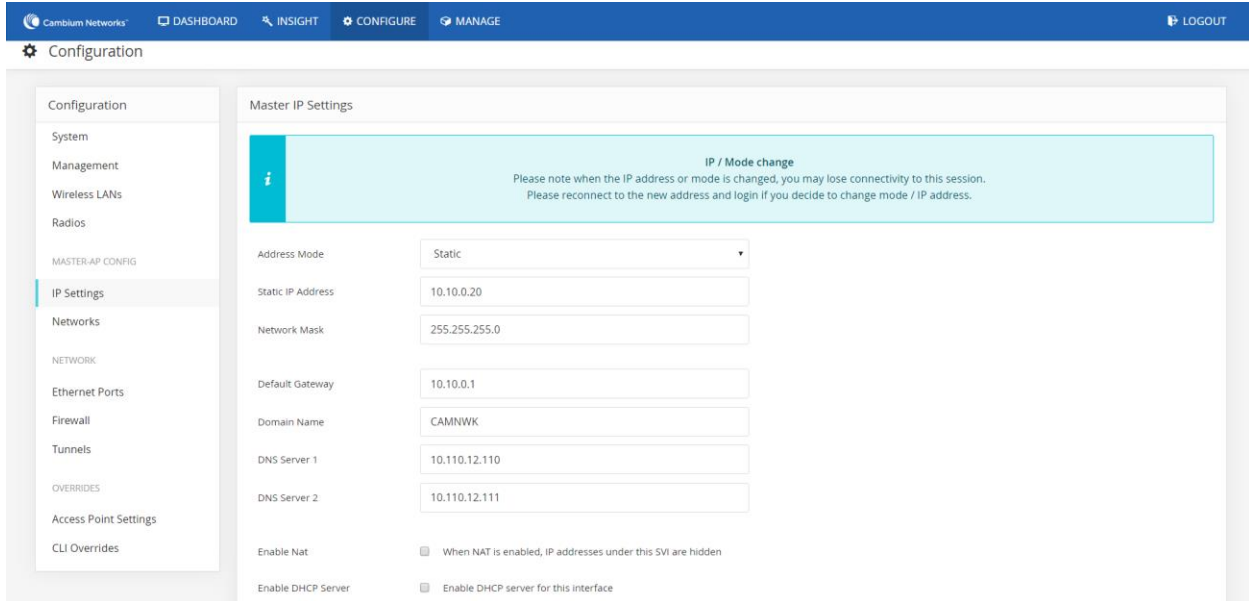

1. Configure country code, ntp server in master AP under **System**.

Figure 102 Configure > Systems

2. Configure static IP on Master.

Figure 103 Configure > IP Settings

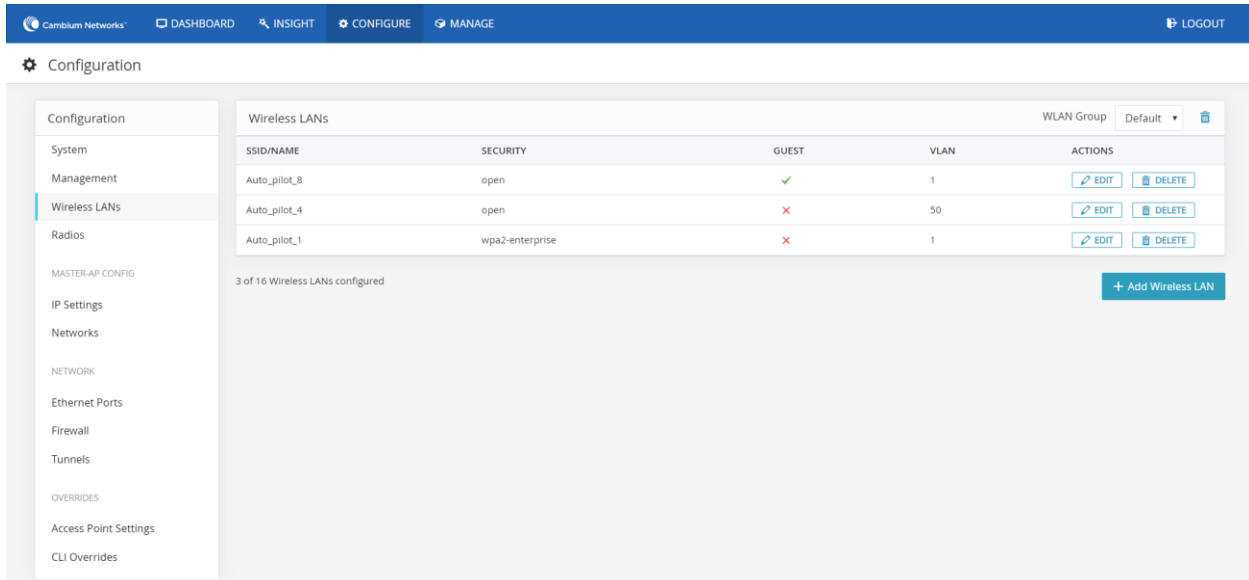

3. Refresh the page after saving with newly configured Ip address. In this example, open URL in browser <http://10.10.10.25>.

Configuring WLAN in default WLAN Group

To configure WLAN in default WLAN group:

1. Add a **Wireless LAN**.

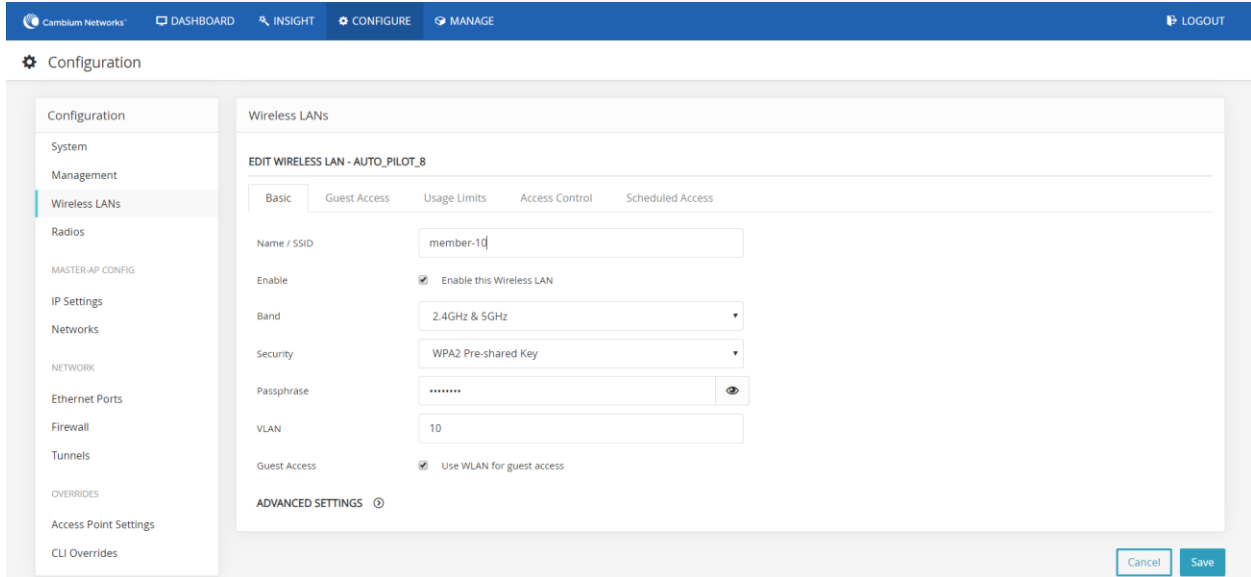

Figure 104 Configure > Wireless LANs

2. Enter **SSID** and password in respective fields.

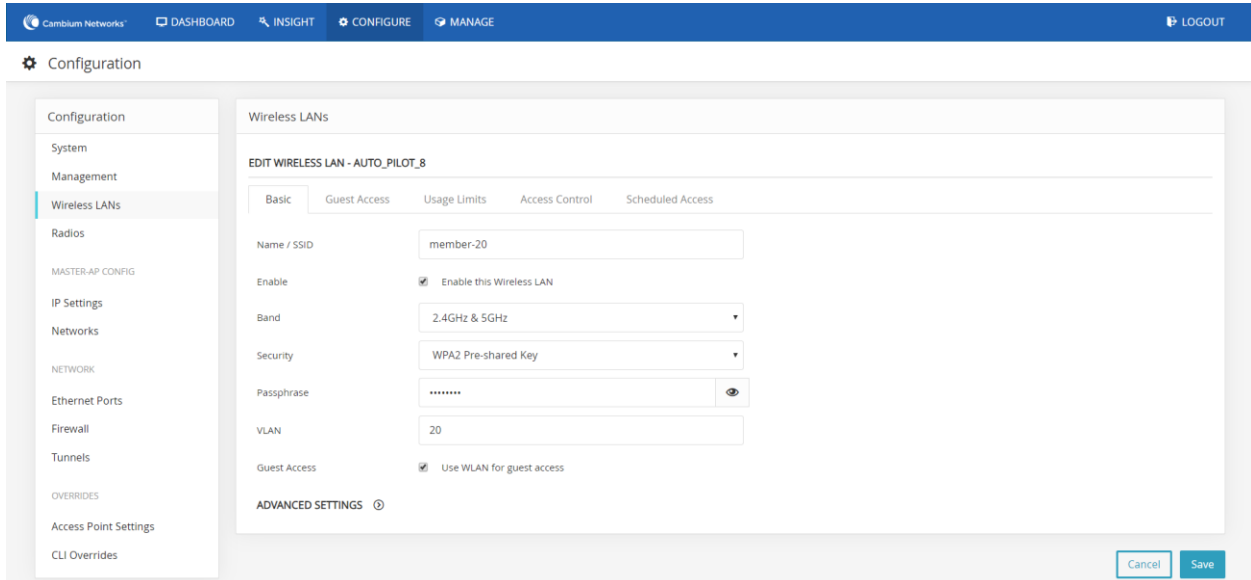

- Configure **VLAN** as 10 and click **Save**.

Figure 105 Configure > Wireless LANs > VLAN 10

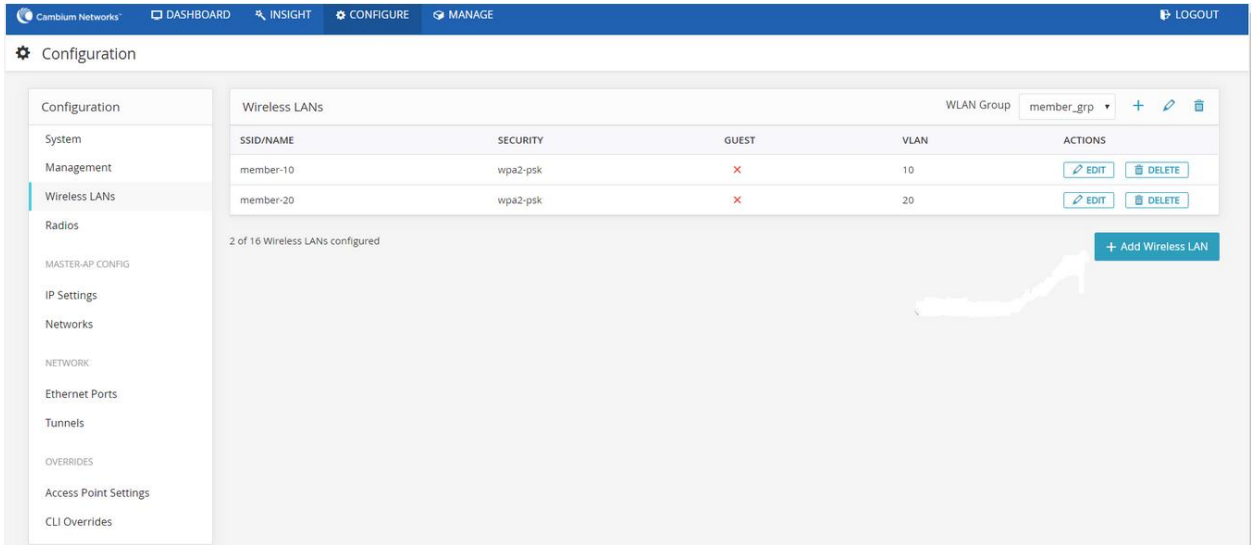

- Add another WLAN with VLAN 20. Enter **SSID** and password as required.
- Configure VLAN as 20 and click **Save**.

Figure 106 Configure > Wireless LANs > VLAN 20

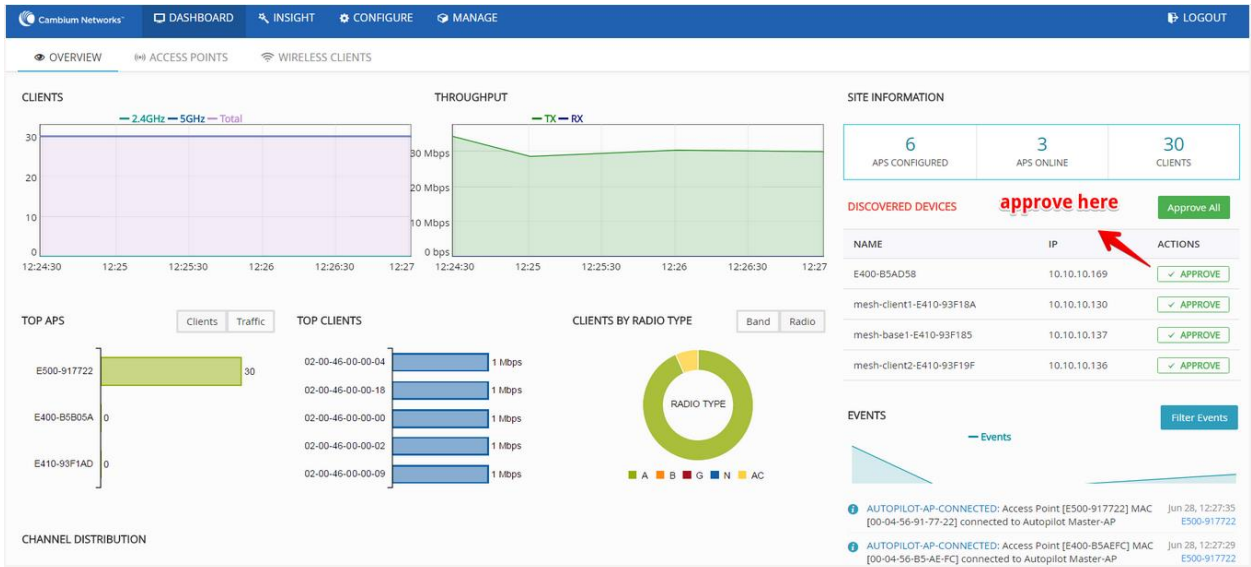

- Check the configured WLANs.

Figure 107 Configure > Wireless LANs > VLAN 10 and 20

7. Connect member APs to the Switch. The connected member APs receive IP from IP address from Master AP on VLAN 1. Once the member APs connect to the Master AP and they are approved, the configured WLANs are pushed to all the approved member APs and Master AP.

Figure 108 Dashboard

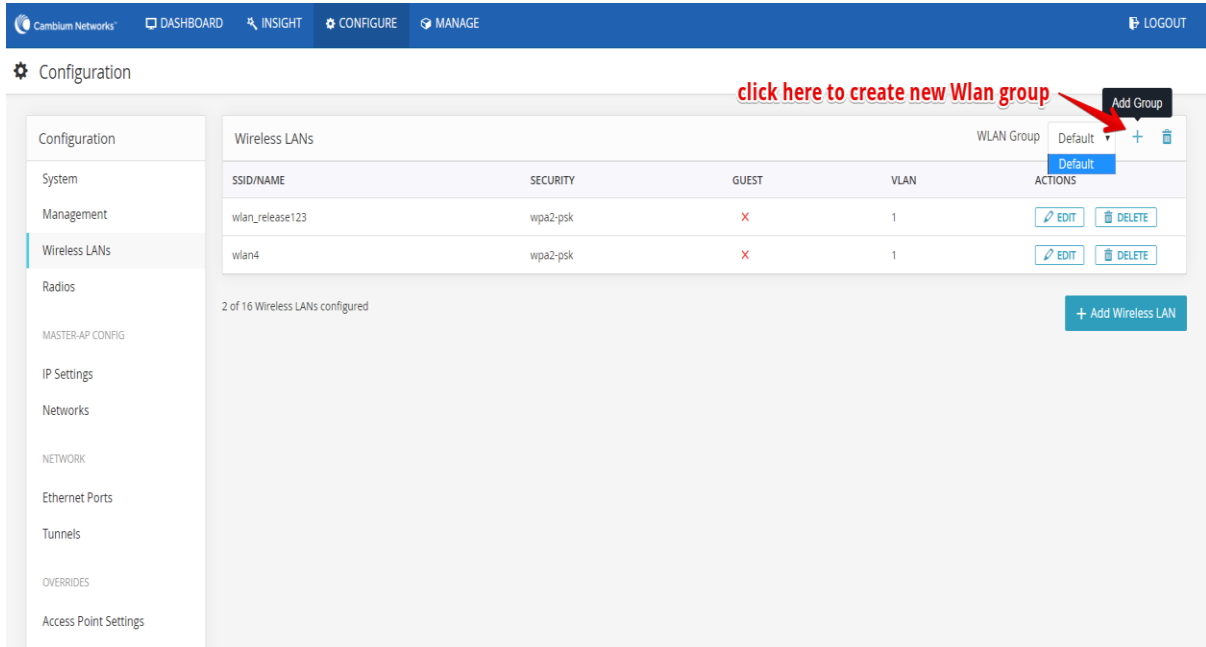

Configuring WLANs with user created WLAN Group

User can group one or multiple WLANs under a WLAN group and push the configuration to specific APs. WLAN group is used to push specific WLANs to specific selected APs.

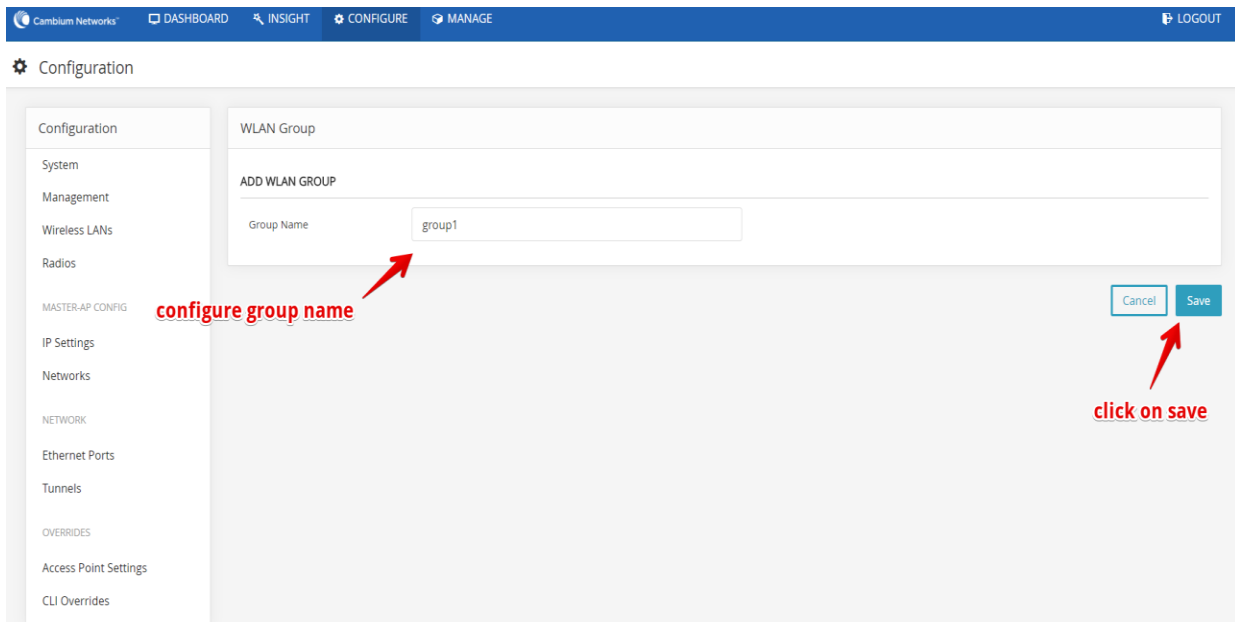

1. Create a WLAN group.

Figure 109 Create a WLAN group

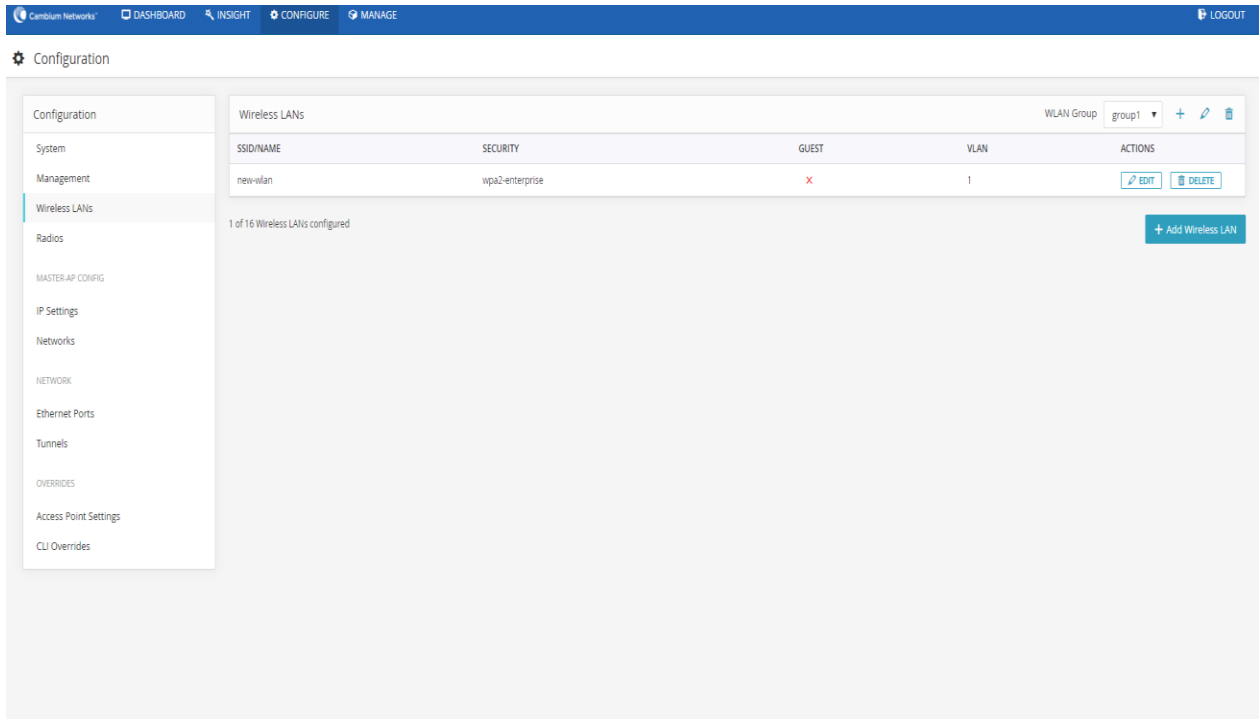

2. Configure a new WLAN Group.

Figure 110 Configure a new WLAN Group

3. Configure WLAN under the newly created WLAN Group.

Figure 111 Configure WLAN under the newly created WLAN Group

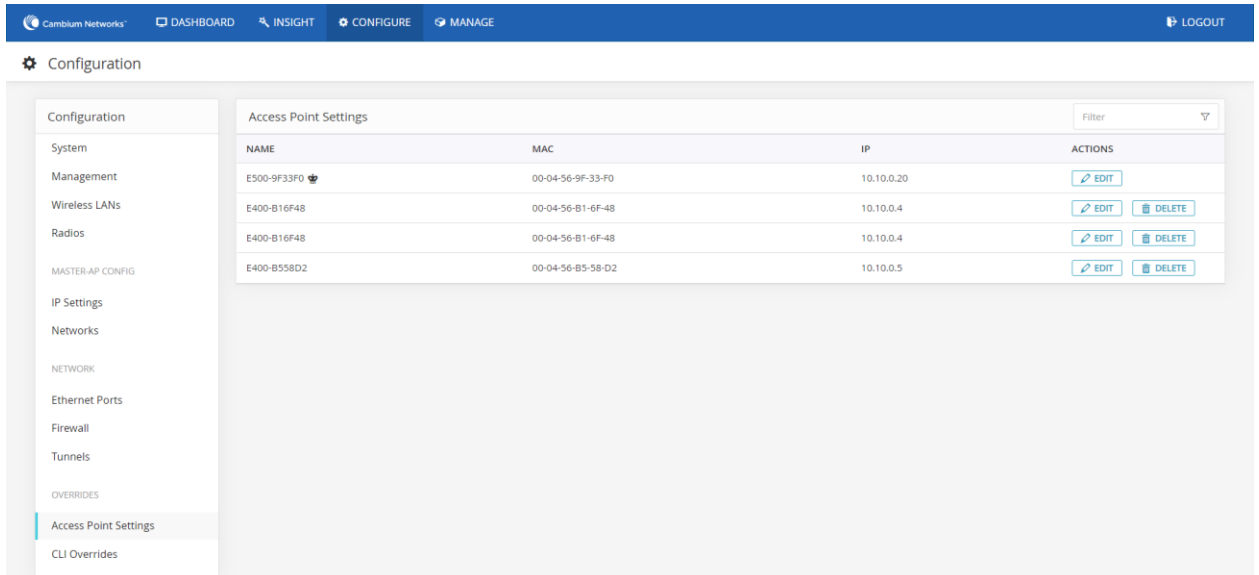

WLAN group override

This section is to describe how user can select device and configure user configured WLAN-group. By selecting device and overriding their WLAN-group, specific WLANs can be pushed to selected devices.

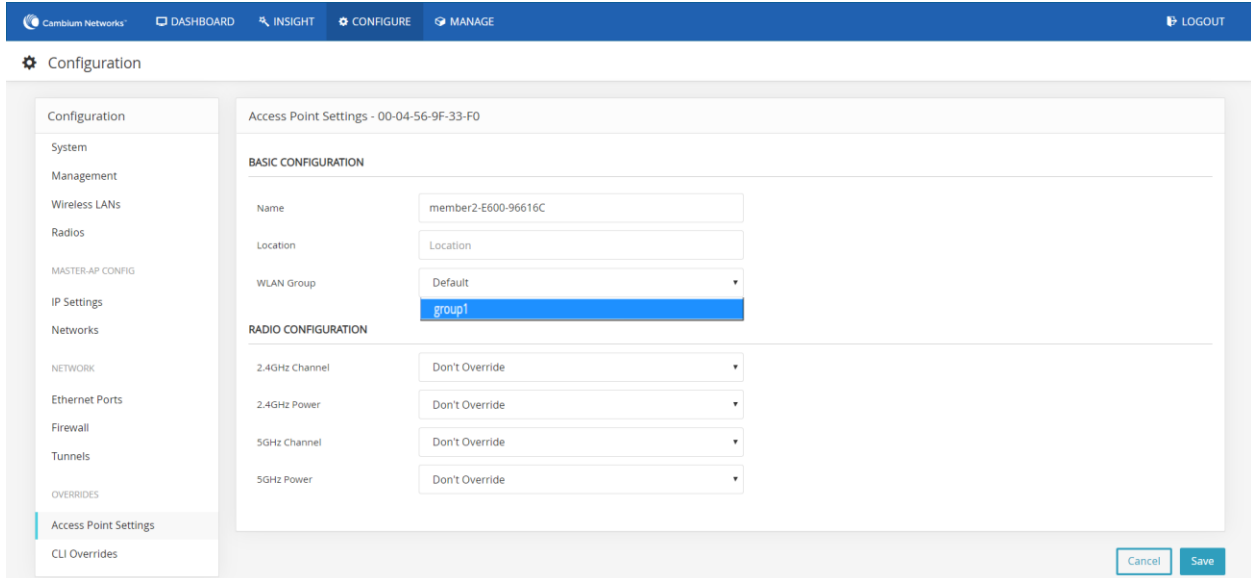

1. Select the device and click **Edit** button.

Figure 112 Configure > Access Point settings

2. Choose the WLAN-group you had configured from the drop-down list and click **Save** button. This will push the WLANs configured under **group1** to the selected AP.

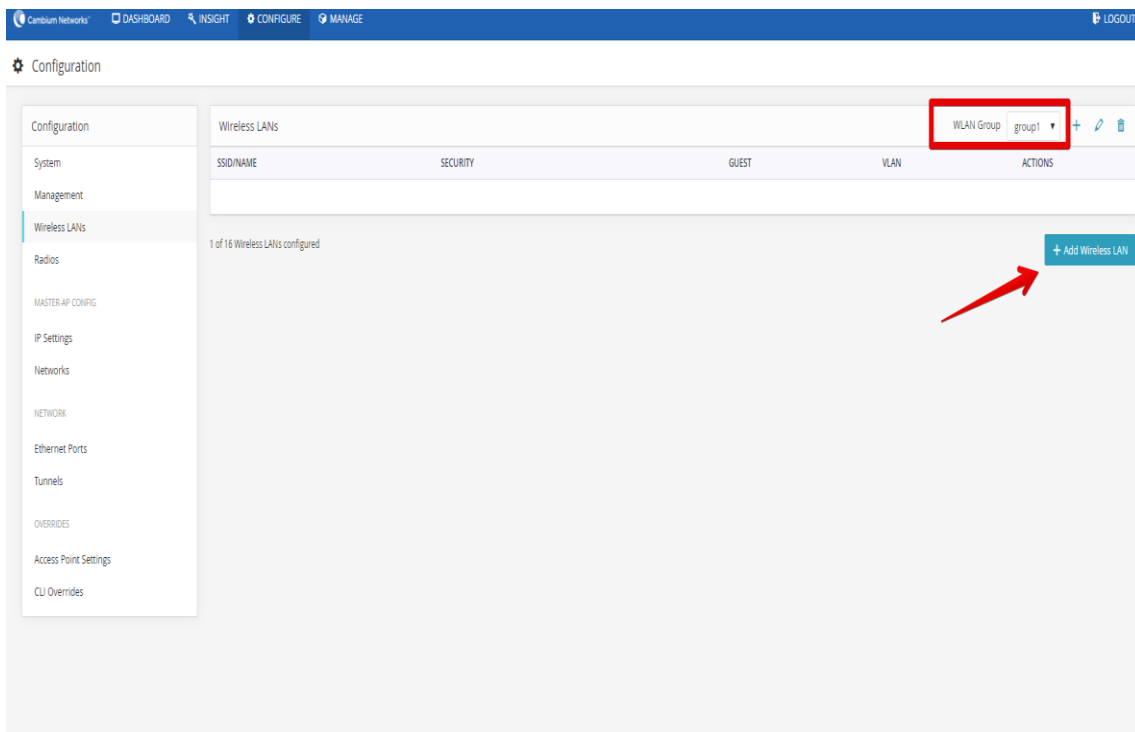

Figure 113 Configure > Access Point settings > WLAN Group

Configuring WPA2-Enterprise WLAN

Follow the below steps to create a WLAN with Enterprise security under **user created WLAN Group**.

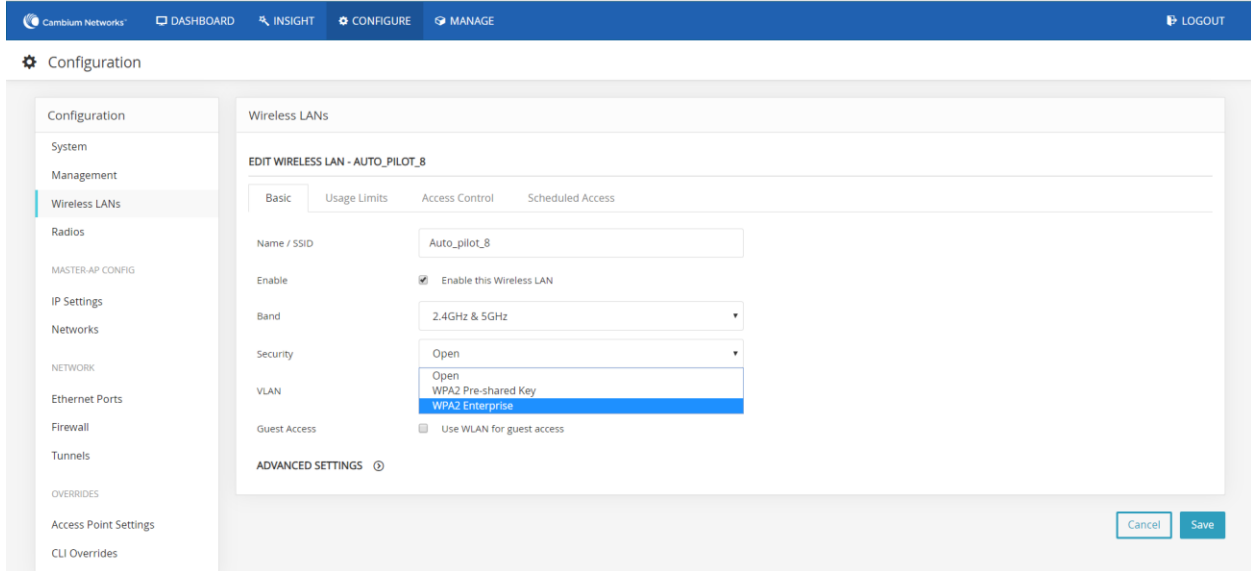

Figure 114 Configure > Access Point settings > user created WLAN Group

1. Enter details in the **WLAN** page.

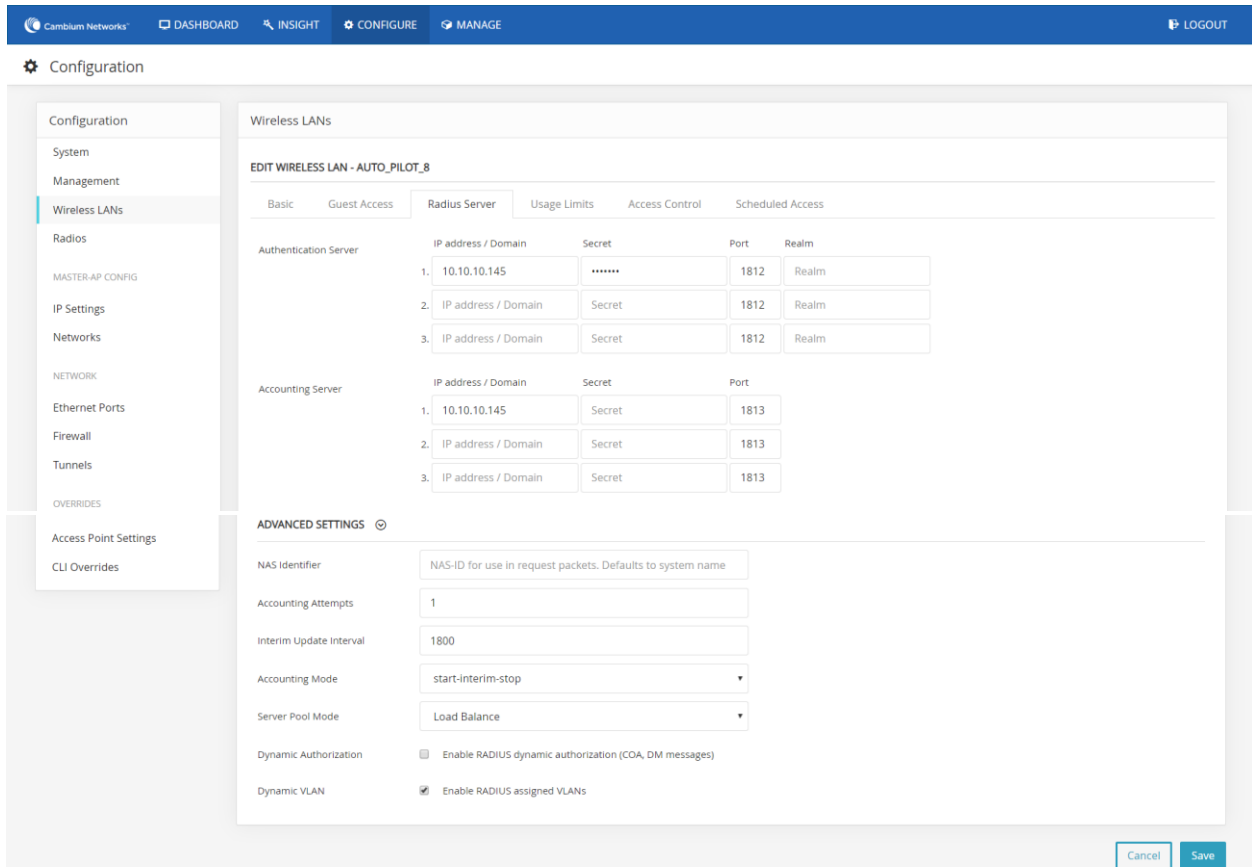

2. Select **Security** as **WPA2-Enterprise** from the drop-down list.
3. Keep **VLAN** as 1.
4. Do not press **Save** button before configuring Radius configurations for authentication.

Figure 115 Configure > Wireless LANs > Security

5. Configure **Radius Server** details for Authentication and for Accounting if applicable. Authentication server details has to be filled before saving the WLAN configuration.

Figure 116 Configure > Wireless LANs > Radius Server

Onboard member APs to Autopilot master

To onboard other member APs to Autopilot Master:

1. Access the Autopilot Master AP via web browser.
2. Login with the below credentials:
 - Username: **admin**
 - Password: **admin**

Figure 117 Login page

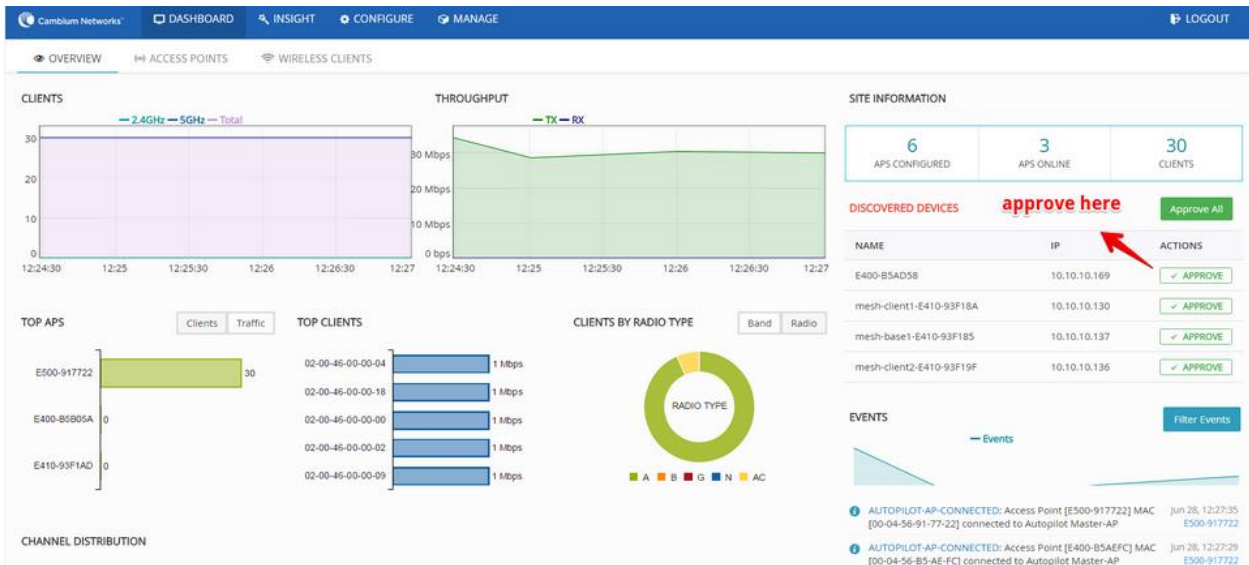

- Go to the **DASHBOARD** tab of the Master AP which displays the list of member APs those have discovered the Master AP.

Note The member AP needs to be upgraded with autopilot firmware.

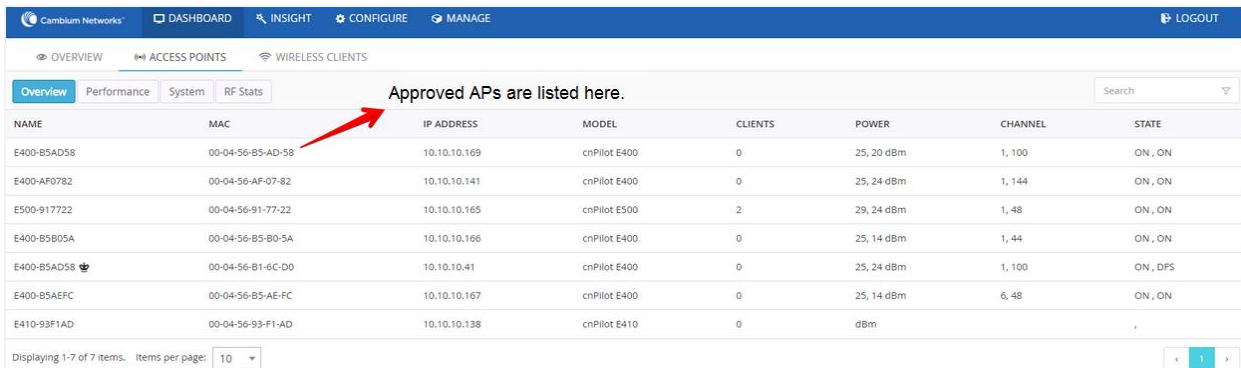

- Click **APPROVE** to approve and manage the desired member AP or click **APPROVE ALL** to approve and manage all the listed APs.

Figure 118 Dashboard > Overview

- The approved member APs are listed under **DASHBOARD > ACCESS POINTS** tab.

Figure 119 Dashboard > Access points

Connect clients to the WLANs and check statistics

- Go to **DASHBOARD > WIRELESS CLIENTS**.
- Connect the listed clients to the configured WLANs and check statistics.

Figure 120 Dashboard > Wireless clients

NAME	MAC	IP	AP	VENDOR	USERNAME	DEVICE TYPE	WLAN	VLAN
android-777	78-7B-8A-9A-9E-77	192.168.10.10	E400-AF0782	Apple		Motorola	member-10	10
ipad-766	80-00-6E-2E-59-3F	192.168.20.10	E400-AF0782	Motorola		iphone	member-20	20

Manage Autopilot

The Manage tab of Autopilot UI manages firmware upgrades, configuration file updates, and technical assistance of the master and member APs. Data is distributed in the following sub-sections:

- **Firmware**
- **System**
- **Tools**

Figure 121 Manage > Firmware

Firmware

This section supports uploading required firmware to master AP, and from master AP to the member APs.

To configure firmware:

1. Go to **Manage > Firmware** tab.
2. Click the **Browse** button to browse the firmware file.

Figure 122 Manage > Upload Firmware

NAME	MAC	IP	MODEL	ACTIVE	BACKUP	STATUS	ACTIONS
E500-9F33F0	00-04-56-9F-33-F0	10.10.0.7	cnPilot E500	3.11-b11	3.11-b9		INSTALL REBOOT

3. Select the required firmware file and click **Open**. For example, firmware file: E400_E50X-3.4.2-b27.img.

Figure 123 To open required Firmware

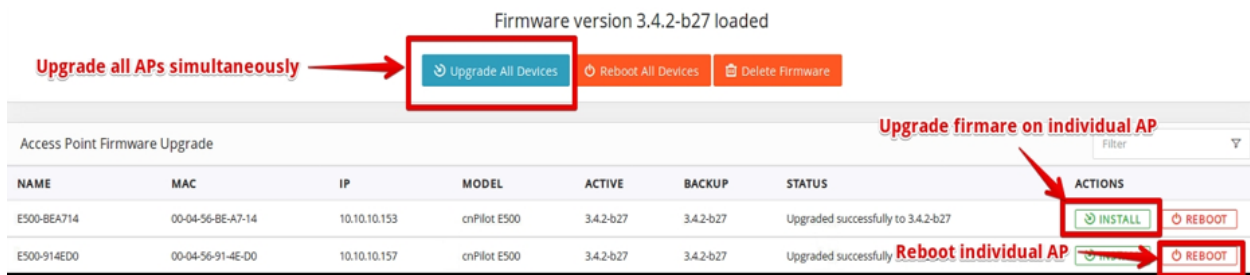

4. Click **Upload Firmware** button and wait for upload.

Figure 124 Upload firmware on Master AP

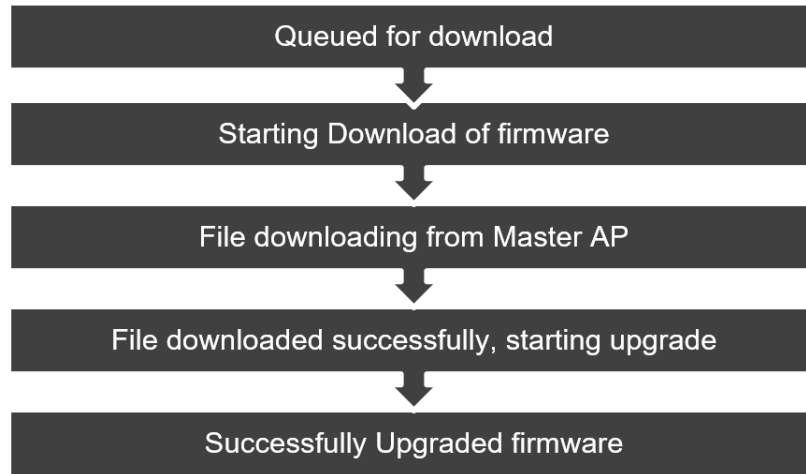

5. By clicking on **Upgrade All Devices** button, the firmware can be upgraded on all APs simultaneously or can be upgraded on each AP separately by clicking on **Install** button provided for every AP on the list.

Figure 125 To upgrade firmware in all devices

Once step 5 is done, the following statuses during the Firmware upgrade can be seen in Figure 126.

Figure 126 Firmware upgraded sequence

6. Different statuses of the firmware upgrade can be seen in Figure 127.

Figure 127 Firmware upgraded status

Note

In case of any error/failure in upgrade status such as **Firmware verification failed** is shown in status column:

1. APs can be rebooted individually by using **Reboot** option.
2. All the APs can be rebooted simultaneously using **Reboot All Devices** option.
3. The loaded firmware can be deleted from the master AP using **Delete Firmware** option.

System

This section provides the following options:

- **Reboot All:** This option is used to reboot all the APs including the master AP simultaneously.
- **Disable Autopilot:** This button is used to disable Autopilot and the entire network of master AP.

Figure 128 System

- **Import Configuration:** This button is used to load any essential configuration and configure Autopilot. Configuration files are stored in .json format.
- **Export configuration:** This button is used to export any new or essential configuration from Autopilot setup and store in .json format for future use.

Figure 129 System > Import/Export Configuration

Access Point Management

This section provides the following options:

- **LED:** This button triggers the LED light on the AP (Hardware) for easy identification.
- **Reboot:** This button is used to individually reboot APs in Autopilot network.
- **Default:** This button is used to set the APs to their default configuration.
- **Delete:** This button is used to delete member APs from the Autopilot network.

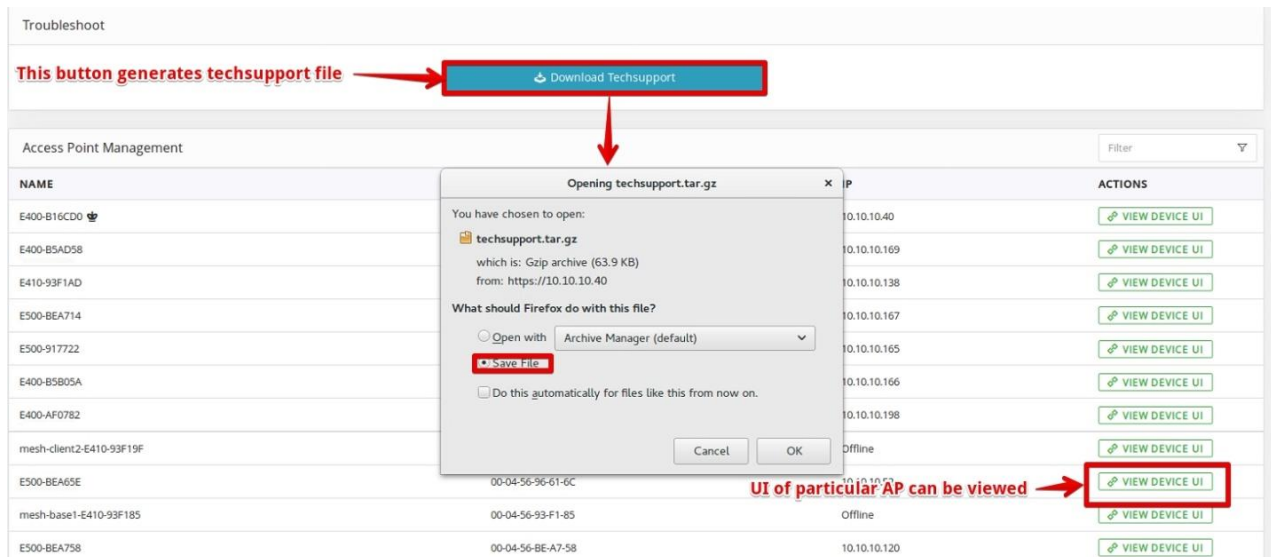

Figure 130 Access Point management

Tools

This section supports downloading technical support file for troubleshooting and viewing User Interfaces of APs.

Figure 131 Tools > Troubleshoot

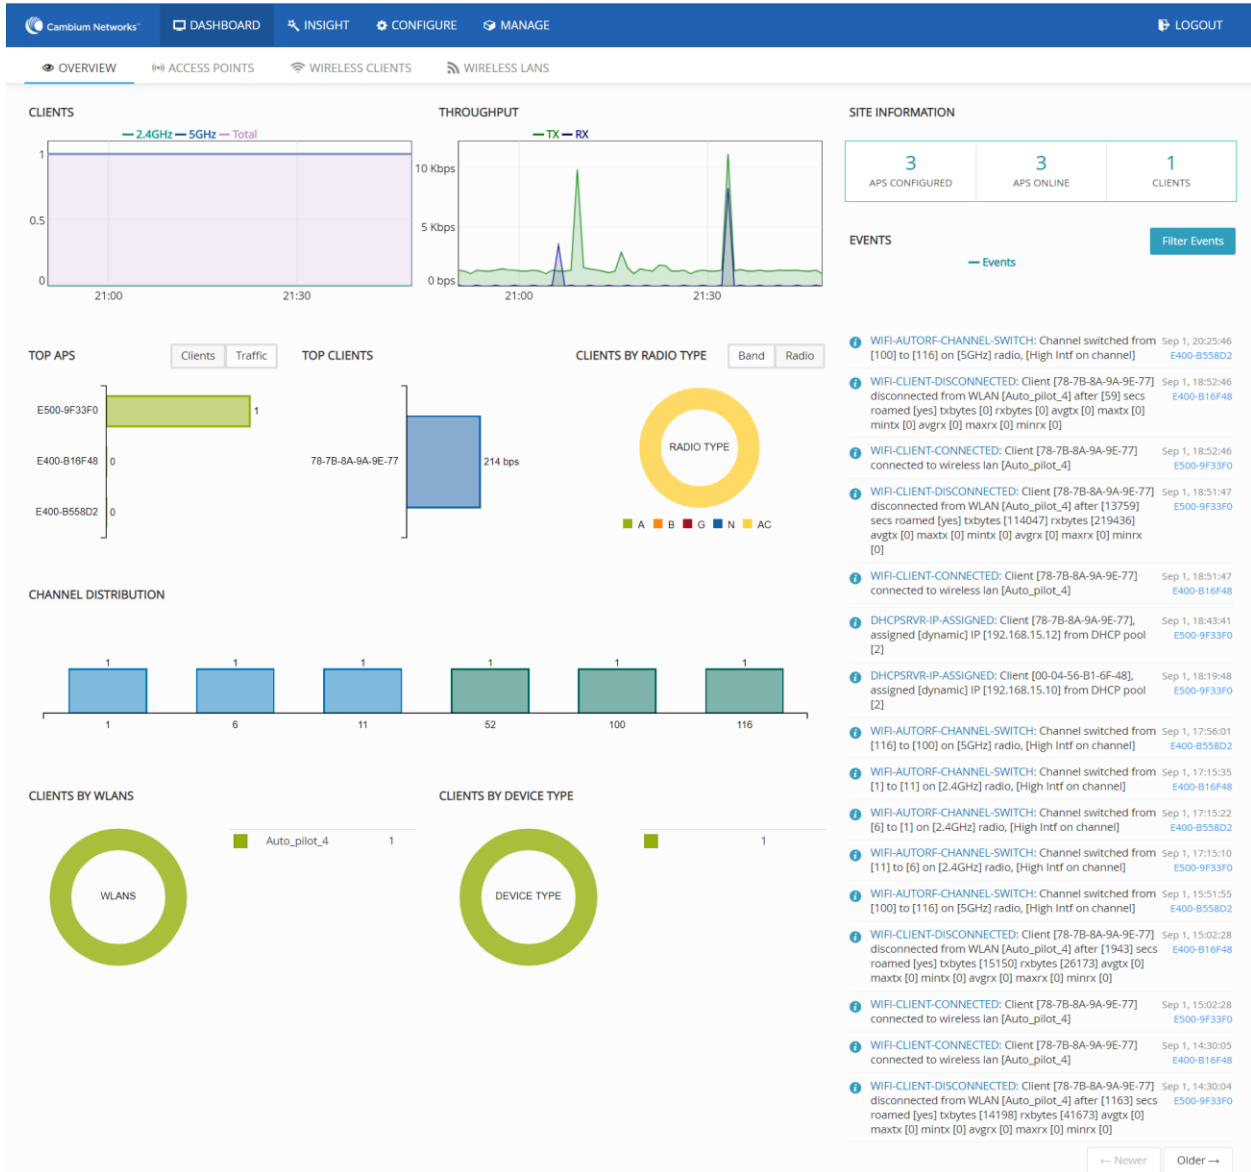

Dashboard

The Dashboard of Autopilot UI provides excellent monitoring capability of the complete setup.

Various graphs and statistics of events, performance, and system information of clients and application is evidently made available to the user. It comprises of following components through which the data is available for monitoring.

Figure 132 Dashboard

Overview

The Dashboard tab comprises of data and various graphs as follows:

- **Site information**
- **Discovered devices**
- **Events**
- **Clients**
- **Throughput**
- **Top Ap**
- **Top clients**

- Clients by Band/Radio type
- Channel distribution
- Clients by WLAN
- Clients by device type

Site information

This section provides the information of number of configured APs, online APs, and number of clients provided.

Figure 133 Dashboard > Overview > Site information

Discovered devices

This table lists all the discovered devices with their names, IP addresses, and actions performed over them. Every device discovered and displayed here should be **APPROVED** for it to be connected to APs network and ready for configuration.

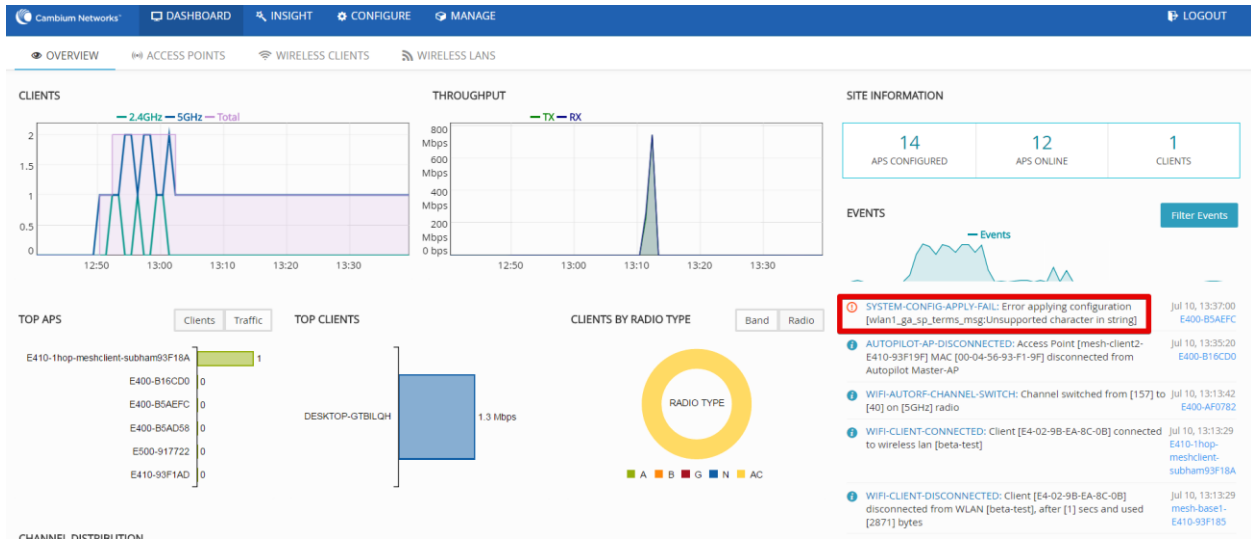

Figure 134 Dashboard > Overview > Discovered devices

DISCOVERED DEVICES			Approve All
NAME	IP	ACTIONS	
E410-93F17C	10.10.10.119	✓ APPROVE	
mesh-base1-E410-93F185	10.10.10.137	✓ APPROVE	

Events

This section continuously streams all the events occurring on the network of AP both graphically and digitally. Graphical spikes can be helpful in representing the network to know how the network is behaving. Any configuration error is also displayed as an event with the reasons mentioned due to which the application of respective configuration failed. For example, check the highlighted event in the below figure.

Figure 135 Dashboard > Overview > Events

Clients

This section graphically streams information about the number of clients connected to specific frequency (2.4 Hz or 5 Hz) and total number of clients at a given time on the present day.

Figure 136 Dashboard > Overview > Clients

Throughput

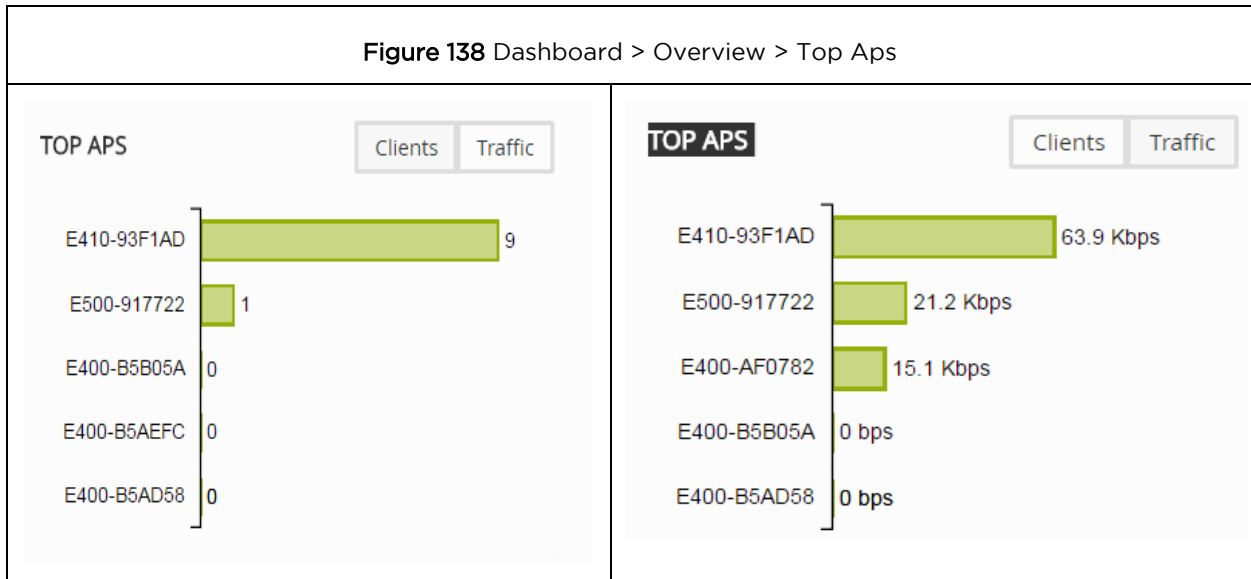

This section graphically represents the TX, RX of each client and total Throughput of all clients against each channel. User can hover over the graph and get more granular details.

Figure 137 Dashboard > Overview > Throughput

Top Aps

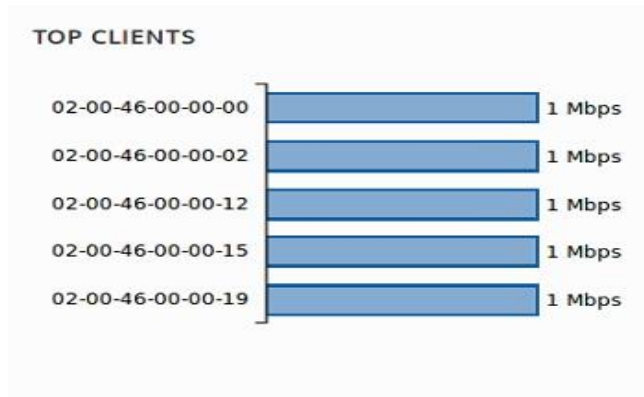

This section graphically displays the top five APs connected to Autopilot’s network along with numbers of clients and traffic in respective frequencies (2.4hz or 5hz).

Top clients

This section graphically represents the top five clients connected to APs with highest traffic flow.

Figure 139 Dashboard > Overview > Top clients

Clients by Band/Radio type

This section provides pie chart representation of the radio types of clients. This shows pie chart based on the percentage of 2.4 GHz and 5 GHz clients connected to Autopilot network. Another pie chart is plotted based on types of clients such as 802.11a, 802.11b/g/n, 802.11ac.

Channel distribution

This section plots and displays the channel distribution between master and member APs as shown below. This helps to know which channels are being used and how many APs are using the channels.

Figure 141 Dashboard > Overview > Channel distribution

Clients by WLANs

This section provides a pie chart representation of all the Clients and WLANs. This helps to instantly know the load on the WLANs.

Figure 142 Dashboard > Overview > Clients by WLANs

Clients by device type

This section provides a pie chart representation of device type (Respective Platforms) of the Clients. This classifies the clients based on type such as Android, Windows clients, Linux, Ipad, Iphone clients, and so on.

Figure 143 Dashboard > Overview > Clients by device type

Access Points

This tab contains details such as Performance, System details, Client details, and so on of all the APs connected to Autopilot. Under Access Point tab, there are four tabs which are as follows:

Overview

This tab provides information such as Name, MAC address, IP Address, Model, number of Clients, Power, Channels, and State of radio of all the APs'.

Performance

This tab displays MAC, IP, Link speed, Total TX (Transmit from APS), and Total RX (Received to APS). For example, if AP transmits data at the speed of 10mbps, then its TX is equal to 10mbps.

Figure 144 Dashboard > Access Points > Performance

NAME	IP ADDRESS	MAC	LINK SPEED	TOTAL TX	TOTAL RX
E500-9F33F0	10.10.0.7	00-04-56-9F-33-F0	1000M	1.2 Kbps	0 bps
E400-B16F48	192.168.15.10	00-04-56-B1-6F-48	1000M	0 bps	0 bps
E400-B558D2	10.10.0.5	00-04-56-B5-58-D2	1000M	0 bps	0 bps

System

This tab displays name, IP address, model, firmware, backup, CPU usage, memory, uptime, and synced configurations of all APs. This helps to know the performance of the APs. Config synced option lets a user to know whether the configuration of an AP is synced with the configuration done on Master. If there is any config sync issue, a red x is displayed as shown in Figure 145.

Figure 145 Dashboard > Access Points > System

NAME	IP ADDRESS	MODEL	FIRMWARE	BACKUP	CPU	MEMORY	UPTIME	CONFIG SYNCED
E500-9F33F0	10.10.0.7	cnPilot E500	3.11-b11	3.11-b9	10 %	48 %	16 hours	✓

E400-AF0782	10.10.10.25	cnPilot E400	3.11-b11	3.11-b9	0%	0%	16 hours	✗

RF stats

This tab displays the number of 2.4G Clients, 5G Clients, TX to 2.4G clients, TX to 5G clients, RX from 2.4G clients, RX from 5G clients. Tx statistic signifies the downlink data speed to the client and Rx signifies uplink data speed from the client.

Figure 146 Dashboard > Access Points > RF Status

NAME	IP ADDRESS	MAC	2.4G CLIENTS	5G CLIENTS	2.4G TX	2.4G RX	5G TX	5G RX

Displaying 1-3 of 3 items. Items per page: 25

Wireless clients

This tab represents details of wireless clients such as vendor type, WLANs, VLANs, RF Stats, and so on.

Overview

The details in this tab include Name, MAC, IP, Vendor type of clients, Usernames (WPA2 enterprise and guest access), Device type (Platform) of Clients, list of WLANs to which clients are connected, and VLAN information of respective WLANs.

Figure 147 Dashboard > Wireless clients

NAME	MAC	IP	AP	VENDOR	USERNAME	DEVICE TYPE	WLAN	VLAN
	02-00-46-00-00-01	10.10.10.155	E400-B16CD0	[Local MAC]		Linux	beta-test	1

Displaying 1-10 of 18 items. Items per page: 10

RF Stats

This tab includes details such as frequency type, radio type, signal, Signal to Noise (SNR), physical rate, TX and RX of clients along with names, MAC, and IP addresses of clients.

Note Less the number in signal better is the signal. For example, -20 is better signal than -70. Similarly, more the SNR better is the signal quality.

Figure 148 Dashboard > Wireless clients > RF status

NAME	MAC	IP	TYPE	RADIO	SIGNAL	SNR	PHY RATE	TX	RX
	02-00-46-00-00-01	10.10.10.155	5GHz	ac	-39 dBm	56 dB	780 M	885.1 Kbps	6.9 Kbps
	02-00-46-00-00-02	10.10.10.122	5GHz	ac	-38 dBm	57 dB	780 M	900.2 Kbps	7 Kbps
	02-00-46-00-00-03	10.10.10.153	5GHz	ac	-39 dBm	56 dB	780 M	872.6 Kbps	6.6 Kbps
	02-00-46-00-00-04	10.10.10.158	5GHz	ac	-39 dBm	56 dB	780 M	863 Kbps	6.7 Kbps
	02-00-46-00-00-05	10.10.10.120	5GHz	ac	-39 dBm	56 dB	780 M	895.2 Kbps	7 Kbps
	02-00-46-00-00-06	10.10.10.100	5GHz	ac	-39 dBm	56 dB	780 M	876.3 Kbps	6.7 Kbps
	02-00-46-00-00-07	10.10.10.154	5GHz	ac	-39 dBm	56 dB	780 M	865.1 Kbps	6.8 Kbps
	02-00-46-00-00-08	10.10.10.159	5GHz	ac	-39 dBm	56 dB	780 M	885.4 Kbps	6.8 Kbps
	02-00-46-00-00-09	10.10.10.156	5GHz	ac	-39 dBm	56 dB	780 M	864.4 Kbps	6.6 Kbps
	02-00-46-00-00-0A	10.10.10.55	5GHz	ac	-39 dBm	56 dB	780 M	884.2 Kbps	6.8 Kbps

Wireless LANs

This tab provides details of all the configured WLANs as follows:

- **GROUP:** Name of the group under which the WLAN is created. WLAN group is used to club single or multiple WLANs and then push the WLAN configurations to selected APs.
- **SSID:** SSID of the WLAN.
- **SECURITY:** Security of the WLAN which can be WPA2-PSK, WPA2-Enterprise, or Open.
- **Tx:** The actual data speed of downlink data. AP to clients.
- **Rx:** The actual data speed of uplink data. Clients to AP.

Figure 149 Dashboard > Wireless LANs

GROUP	SSID	SECURITY	CLIENTS	TX	RX
Default	Auto_pilot_8	open	0	0 bps	0 bps
diva1	diva_wlan1	open	0	0 bps	0 bps
Default	Auto_pilot_4	open	1	74 bps	140 bps
Default	Auto_pilot_1	wpa2-enterprise	0	0 bps	0 bps

Displaying 1-4 of 4 Items. Items per page: 25

Insight

Insight option of Autopilot UI provides accurate insights on an AP anomalies which are distributed on the sub tabs as follows:

- Pulse
- Timeview
- Events

On the top left corner of the page the master and the member APs can be selected from the drop-down list. Site default gives overall details.

Figure 150 Insight > Pulse

ACCESS POINT ANOMALIES

- High CPU Usage** (0): Tracks Access Points which use very high CPU. Threshold is currently configured at 90%.
- High Memory Usage** (0): Tracks Access Points which use very high memory. Threshold is currently configured at 90%.
- No WLANs Mapped** (0): Tracks Access Points which do not have any wireless lans configured.
- No Clients** (2): Tracks Access Points which do not have any clients associated.
- No Gigabit Ethernet** (0): Tracks Access Points which did not auto-neg Gigabit network speed.
- Less uptime** (0): Tracks Access Points which came up within the last 30 minutes.
- Client overload** (0): Tracks Access Points which have more than 100 clients.
- Mismatched Firmware** (0): Tracks Access Points which do not have the latest firmware.

Site : Default

Select Site / AP

- Site : Default
- AP : E500-9F33F0
- AP : E400-B16F48
- AP : E400-B558D2

Pulse

This tab provides the detailed information of the following:

- **High CPU usage:** On clicking, this option leads to **TIMEVIEW** page of Insight tab and tracks the CPU usage of all APs graphically.
- **No WLANs mapped:** This option leads to APs page of Dashboard tab and tracks number of APs without wireless LANs configured.

- **No Gigabit ethernet:** This option leads to APs page of Dashboard tab and tracks APs which do not auto negotiate Gigabit network speed.
- **Client overload:** This option leads to AP page of Dashboard and gives the number of clients connected to every AP and also points the AP connected by highest number of clients.
- **High memory usage:** Tracks the memory usage of all APs and the highest memory usage and leads to **TIMEVIEW** page of the Insight tab, when clicked upon.
- **No clients:** Tracks the APs which do not have any clients connected to them along with their details like IP Address, Mac Address, and Model etc. On clicking leads to APs page on Dashboard.
- **Less uptime:** Lists all the APs which were activated within the last 30 minutes along with their details and leads to Overview page on Dashboard.
- **Mismatched firmware:** Provides information related to mismatch of software with respect to Master device.

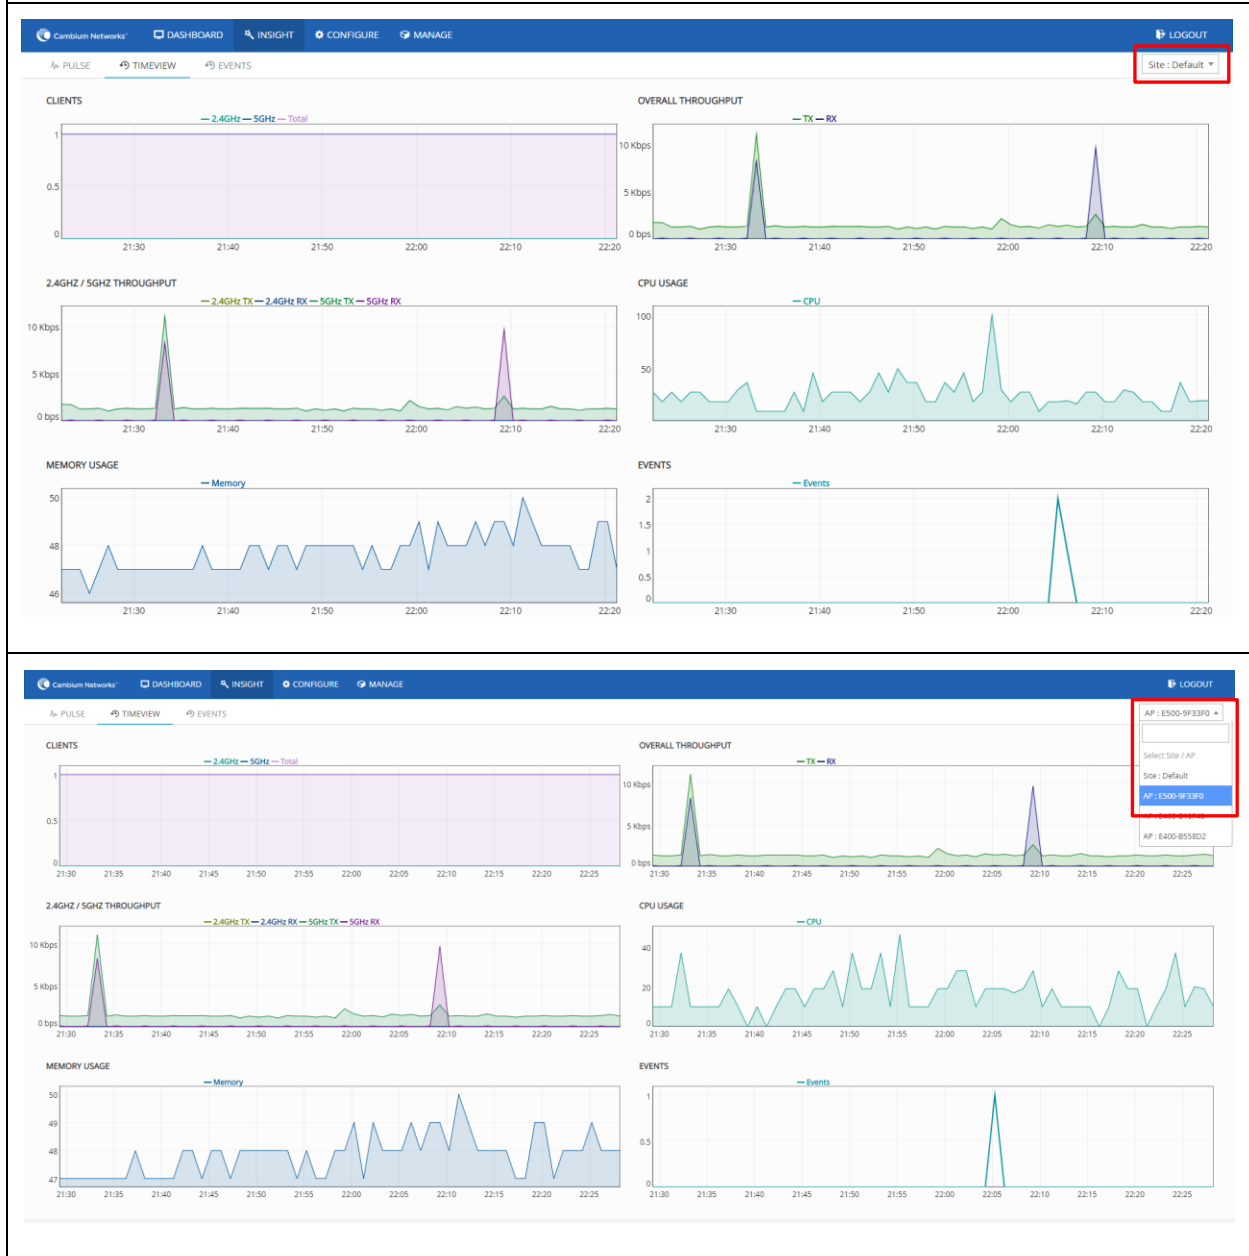

Note

In current version not all of these options are supported.

Timeview

This tab provides the graphical interpretation of CPU usage, Memory Usage, Clients, Overall Throughput, and Throughput by frequencies and Events. Also, the maximum (Graphical Peaks) and minimum values of all the mentioned components can be tracked accurately.

Figure 151 Insight > Timeview

Events

This tab provides the list of all the latest events of master and member APs. Events can be filtered for specific APs based on their event name, content, Mac or IP address. All the old events can be cleared to start afresh.

Figure 152 Insight > Unfiltered Events

The screenshot shows the 'EVENTS' section of the cnPilot Insight interface. At the top, there are navigation tabs: PULSE, TIMEVIEW, and EVENTS (selected). A search bar contains the text 'Filter text : Can include event name, content, IP or MAC'. Below this, a list of events is shown. A red box highlights the following events:

- WIFI-AUTORF-CHANNEL-SWITCH: Channel switched from [1] to [6] on [2.4GHz] radio, [High Intf on channel]
- WIFI-AUTORF-CHANNEL-SWITCH: Channel switched from [6] to [11] on [2.4GHz] radio, [High Intf on channel]
- WIFI-AUTORF-CHANNEL-SWITCH: Channel switched from [11] to [6] on [2.4GHz] radio, [High Intf on channel]
- WIFI-AUTORF-CHANNEL-SWITCH: Channel switched from [100] to [116] on [5GHz] radio, [High Intf on channel]
- WIFI-CLIENT-DISCONNECTED: Client [78-7B-8A-9A-9E-77] disconnected from WLAN [Auto_pilot_4] after [59] secs roamed [yes] tbytes [0] rxbytes [0] avgtx [0] maxtx [0] mintx [0] avgrx [0] maxrx [0] minrx [0]

Chapter 16: Guest Access Portal- INTERNAL

Introduction

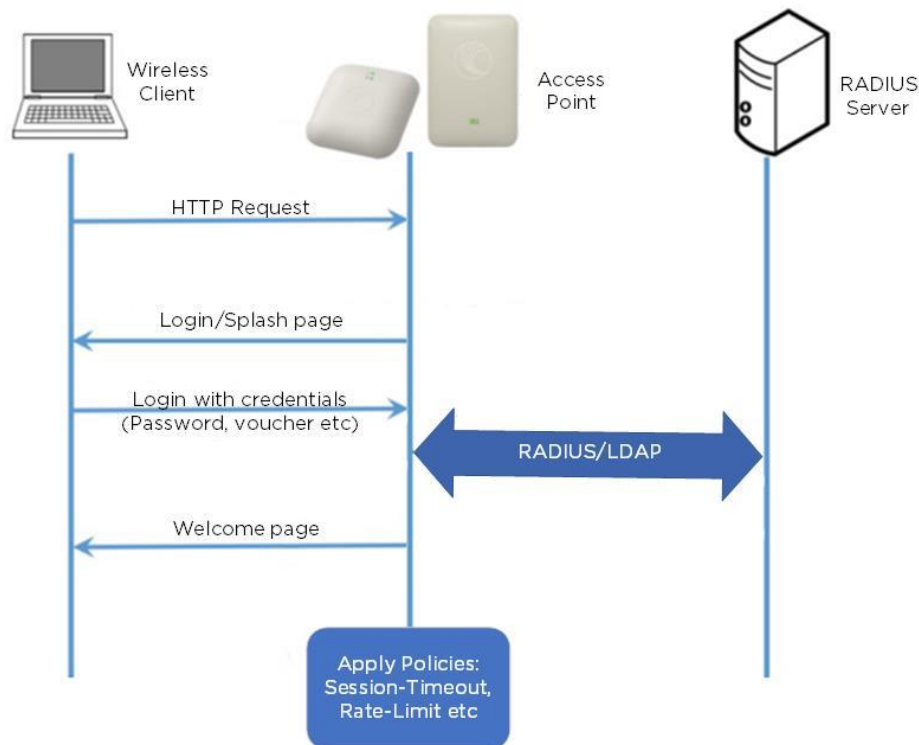

Guest Access Portal services offers a simple way to provide secure access to internet for users and devices using a standard web browser. Guest access portal allows enterprises to offer authenticated access to the network by capturing and re-directing a web browsers session to a captive portal login page where the user must enter valid credentials to be granted access to the network.

Modes of Captive Portal Services supported by cnPilot devices:

- **Internal Access:** Captive Portal server is hosted on access point and is local to access point.
- **External Access:** cnPilot is integrated with multiple third-party Captive Portal services vendor. Based on the vendor, device needs to be configured. More details on this Guest Access Portal method is described in [Chapter 17](#).
- **cnMaestro:** Captive Portal services are hosted on cnMaestro where various features like Social login, Voucher login, SMS login and Paid login is supported. More details on this Guest Access Portal method is described in [Chapter 18](#).

Here in this chapter we will brief about Internal Captive Portal services supported by cnPilot Access Points. Figure 143 displays the basic topology of testing Internal Captive Portal Service.

Figure 154 Topology

Configurable Parameters

Figure 144 displays multiple configurable parameters supported for Internal Guest Access hosted on AP. Access Policy – Clickthrough

Figure 155 Configure: WLAN > Guest Access > Internal Access Point parameter

Basic	Radius Server	Guest Access	Usage Limits	Scheduled Access	Access	Passpoint	Delete

Access policy

- **Click through**

When this policy is selected, user will get a login page to accept “Terms and Conditions” to get access to network. No additional authentication is required.

- **RADIUS**

When this policy is selected, user will be prompted for credentials, which is authenticated by Radius server. Radius server details can be configured on device at **Configure > WLAN > RADIUS**.

- **LDAP**

When this policy is selected, user will be prompted for credentials, which is authenticated by LDAP/AD server. LDAP server details can be configured on device at **Configure > WLAN > Guest Access > LDAP**.

- **Local Guest Account**

When this policy is selected, username and password is configured on device and it can be used as credentials for all wireless users connected to this WLAN profile to gain internet access.

Splash page

Title

You can configure the contents of splash page using this field. Contents should not exceed more than 255 characters.

Contents

You can configure the contents of splash page using this field. Contents should not exceed more than 255 characters.

Terms and conditions

Terms and conditions to be displayed on the splash page can be configured using this field. Terms and conditions should not exceed more than 255 characters.

Logo

Displays the logo image updated in URL [http\(s\)://<ipaddress>/<logo.png>](http(s)://<ipaddress>/<logo.png>). Either PNG or JPEG format of logo are supported.

Background image

Displays the background image updated in URL [http\(s\)://<ipaddress>/background/<image.png>](http(s)://<ipaddress>/background/<image.png>). Either PNG or JPEG format of logo are supported.

Redirect Parameters

Redirect hostname

User can configure a friendly hostname, which is added in DNS server and is resolvable to cnPilot IP address. This parameter once configured will be replaced with IP address in the redirection URL provided to wireless stations.

Success action

Provision to configure redirection URL after successful login to captive portal services. User can configure three modes of redirection URL:

- **Internal logout Page**

After successful login, Wireless client is redirected to logout page hosted on AP.

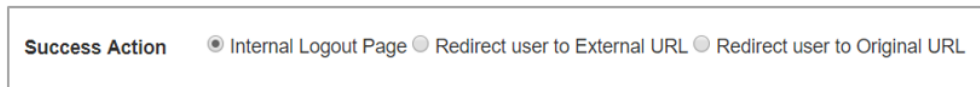

- **Redirect users to external URL**

Here users will be redirected to URL which we configured on device as below:

- **Redirect users to Original URL**

Here users will be redirected to URL that is accessed by user before successful captive portal authentication.

Figure 156 Success action

Redirect

By default, captive portal redirection is trigger when user access either HTTP or HTTPs WWW. If enabled, redirection to Captive Portal Splash Page is triggered when a HTTP WWW is accessed by end user.

Figure 157 Redirect

Redirect Mode

There are two redirect modes available:

- **HTTP Mode**

When enabled, AP sends a HTTP POSTURL to the client.

- **HTTP(s) Mode**

When enabled, AP sends HTTPS POST URL to the client

Proxy redirection port

Proxy redirection port can be configured with which proxy server is enabled. This allows URL's accessed with proxy port to be redirected to login page.

Redirect user page

IP address configured in this field is used as logout URL for Guest Access sessions. IP address configured should be not reachable to internet.

Figure 158 Redirect user page

Redirect User Page	<input style="width: 200px;" type="text" value="1.1.1.1"/> <i>Configure IP address for redirecting user to guest portal splash page</i>
---------------------------	--

Logout re-direction URLs are as follows:

- [http\(s\)://<Redirect user Page>/logout](http(s)://<Redirect user Page>/logout)

Success Message

This we can configure so that we can display success message on the splash page after successful authentication.

Figure 159 Success Message

Success message	<input style="width: 250px;" type="text"/>
------------------------	--

Timeout

Session

This is the duration of time which wireless client will be allowed internet after guest access authentication.

Figure 160 Configure: WLAN > Guest Access > Session timeout

Session Timeout	<input style="width: 80px;" type="text" value="28800"/>	<i>Session time in seconds (60 to 2592000)</i>
------------------------	---	--

Inactivity

This is the duration of time after which wireless client will be requested for re-login.

Figure 161 Configure: WLAN > Guest Access > Inactivity timeout

Inactivity Timeout	<input style="width: 80px;" type="text" value="1800"/>	<i>Inactivity time in seconds (60 to 2592000)</i>
---------------------------	--	---

MAC Authentication fallback

It is a fall back mechanism in which wireless clients will be redirected to Guest access login Page after Radius based Mac authentication failure. This means When AP detects RADIUS authentication has failed for a wireless client, AP will send a HTTP Post with respect to redirection URL to the client for guest access authentication.

Figure 162 Configure: WLAN > Guest Access > MAC Authentication fallback

MAC Authentication Fallback *Use guest-access only as fallback for clients failing MAC-authentication*

Extended interface

Provision to support Guest Access on Ethernet interface.

Figure 163 Configure: WLAN > Guest Access > Extended interface

Extend Interface *Configure the interface which is extended for guest access*

Whitelist

Provision to configure either Ips or URLs to bypass traffic, therefor user can access those Ips or URLs without Guest Access authentication.

Captive portal bypass user agent

Provision to limit the auto-popup to a certain browser as configured based on User-agent of browsers.

Figure 164 Configure: WLAN > Guest Access > Captive portal bypass user agent

Chapter 17: Guest Access Portal- EXTERNAL

Introduction

Guest access WLAN is designed specifically for BYOD (Bring your own device) setup, where large organizations have both staff and guests running on same WLAN or similar WLANs. Cambium Networks provides different options to the customers to achieve this based on where the captive portal page is hosted and who will be validating and performing authentication process.

External Hotspot is a smart Guest Access provision supported by cnPilot devices. This method of Guest Access provides a flexibility of integrating an external 3rd party Web/Cloud hosted captive portal, fully customized. More details on third party vendors who are integrated and certified with Cambium are listed in the URL https://www.cambiumnetworks.com/wifi_partners/.

Configurable Parameters

Figure 165 displays multiple configurable parameters supported for External Guest Access hosted on AP.

Figure 165 Configure: WLAN > Guest Access > External Access Point parameter

Basic	Radius Server	Guest Access	Usage Limits	Scheduled Access	Access	Passpoint	
							Delete
Enable	<input checked="" type="checkbox"/>						
Portal Mode	<input type="radio"/> Internal Access Point <input checked="" type="radio"/> External Hotspot <input type="radio"/> cnMaestro						
Access Policy	<input checked="" type="radio"/> Clickthrough <i>Splash-page where users accept terms & conditions to get on the network</i> <input type="radio"/> Radius <i>Splash-page with username & password, authenticated with a RADIUS server</i> <input type="radio"/> LDAP <i>Redirect users to a login page for authentication by a LDAP server</i> <input type="radio"/> Local Guest Account <i>Redirect users to a login page for authentication by local guest user account</i>						
Redirect Mode	<input checked="" type="radio"/> HTTP <i>Use HTTP URLs for redirection</i> <input type="radio"/> HTTPS <i>Use HTTPS URLs for redirection</i>						
Redirect Hostname	<input type="text"/> <i>Redirect Hostname for the splash page (up to 255 chars)</i>						
WISPr Clients External Server Login	<input type="checkbox"/>

Extend Interface	<input type="text"/> <i>Configure the interface which is extended for guest access</i>						
<input type="button" value="Save"/> <input type="button" value="Cancel"/>							

Access policy

- **Click through**

When this policy is selected, user will get a login page to accept “Terms and Conditions” to get access to network. No additional authentication is required.

- **RADIUS**

When this policy is selected, user will be prompted for credentials, which is authenticated by Radius server. Radius server details can be configured on device at **Configure > WLAN > RADIUS**.

- **LDAP**

When this policy is selected, user will be prompted for credentials, which is authenticated by LDAP/AD server. LDAP server details can be configured on device at **Configure > WLAN > Guest Access > LDAP**.

- **Local Guest Account**

When this policy is selected, username and password is configured on device and it can be used as credentials for all wireless users connected to this WLAN profile to gain internet access.

WISPr

WISPr Clients External Server Login

Provision to enable re-direction of guest access portal URL obtained through WISPr.

External Portal Post Through cnMaestro

This is required when HTTPS is only supported by external guest access portal. This option when enabled minimizes certification. Certificate is required to install only in cnMaestro On-Premises.

External Portal Type

Two modes of portal types are supported by cnPilot products.

Standard

This mode is selected, for all third-party vendors whose Guest Access services is certified and integrated with cnPilot products.

XWF

This mode is selected for Facebook Express Wi-Fi deployment.

Redirect Parameters

Redirect hostname

User can configure a friendly hostname, which is added in DNS server and is resolvable to cnPilot IP address. This parameter once configured will be replaced with IP address in the redirection URL provided to wireless stations.

Note

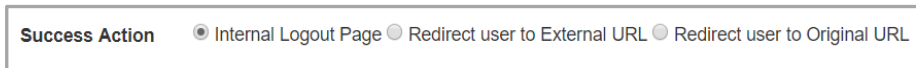

This can be used to mask the IP address of the AP with some string.

Success action

Provision to configure redirection URL after successful login to captive portal services. User can configure three modes of redirection URL:

- **Internal logout Page**
After successful login, Wireless client is redirected to logout page hosted on AP.
- **Redirect users to external URL**
Here users will be redirected to URL which we configured on device as below:
- **Redirect users to Original URL**
Here users will be redirected to URL that is accessed by user before successful captive portal authentication.

Figure 166 Success action

Redirect

By default, captive portal redirection is trigger when user access either HTTP or HTTPs WWW. If enabled, redirection to Captive Portal Splash Page is triggered when a HTTP WWW is accessed by end user.

Figure 167 Redirect

Redirect Mode

There are two redirect modes available:

- **HTTP Mode**
When enabled, AP sends a HTTP POSTURL to the client.
- **HTTP(s) Mode**
When enabled, AP sends HTTPS POST URL to the client

Proxy redirection port

Proxy redirection port can be configured with which proxy server is enabled. This allows URL's accessed with proxy port to be redirected to login page.

Redirect user page

IP address configured in this field is used as logout URL for Guest Access sessions. IP address configured should be not reachable to internet.

Figure 168 Redirect user page

The screenshot shows a configuration field labeled "Redirect User Page" with the value "1.1.1.1" entered. Below the input field, there is a blue italicized instruction: "Configure IP address for redirecting user to guest portal splash page".

Logout re-direction URLs are as follows:

- [http\(s\)://<Redirect user Page>/logout](http(s)://<Redirect user Page>/logout)

Redirection URL Query String

Following information is appended in the redirection URL, if "Prefix Query Strings in Redirect URL" is enabled.

- Client IP
- RSSI
- AP Location

Success Message

This we can configure so that we can display success message on the splash page after successful authentication

Figure 169 Success Message

The screenshot shows a configuration field labeled "Success message" with an empty text input box next to it.

Timeout

Session

This is the duration of time which wireless client will be allowed internet after guest access authentication.

Figure 170 Configure: WLAN > Guest Access > Session timeout

The screenshot shows a configuration field labeled "Session Timeout" with the value "28800" entered. To the right of the input field, there is a blue italicized instruction: "Session time in seconds (60 to 2592000)".

Inactivity

This is the duration of time after which wireless client will be requested for re-login.

Figure 171 Configure: WLAN > Guest Access > Inactivity timeout

Inactivity Timeout	<input type="text" value="1800"/>	<i>Inactivity time in seconds (60 to 2592000)</i>
---------------------------	-----------------------------------	---

MAC Authentication fallback

It is a fall back mechanism in which wireless clients will be redirected to Guest access login Page after Radius based Mac authentication failure. This means When AP detects RADIUS authentication has failed for a wireless client, AP will send a HTTP Post w.r.t redirection URL to the client for guest access authentication

Figure 172 Configure: WLAN > Guest Access > MAC Authentication fallback

MAC Authentication Fallback	<input type="checkbox"/>	<i>Use guest-access only as fallback for clients failing MAC-authentication</i>
------------------------------------	--------------------------	---

Extended interface

Provision to support Guest Access on Ethernet interface.

Figure 173 Configure: WLAN > Guest Access > Extended interface

Extend Interface	<input type="text"/>	<i>Configure the interface which is extended for guest access</i>
-------------------------	----------------------	---

Whitelist

Provision to configure either Ips or URLs to bypass traffic, therefor user can access those Ips or URLs without Guest Access authentication.

Captive portal bypass user agent

Provision to limit the auto-popup to a certain browser as configured based on User-agent of browsers.

Figure 174 Configure: WLAN > Guest Access > Captive portal bypass user agent

Configuration examples

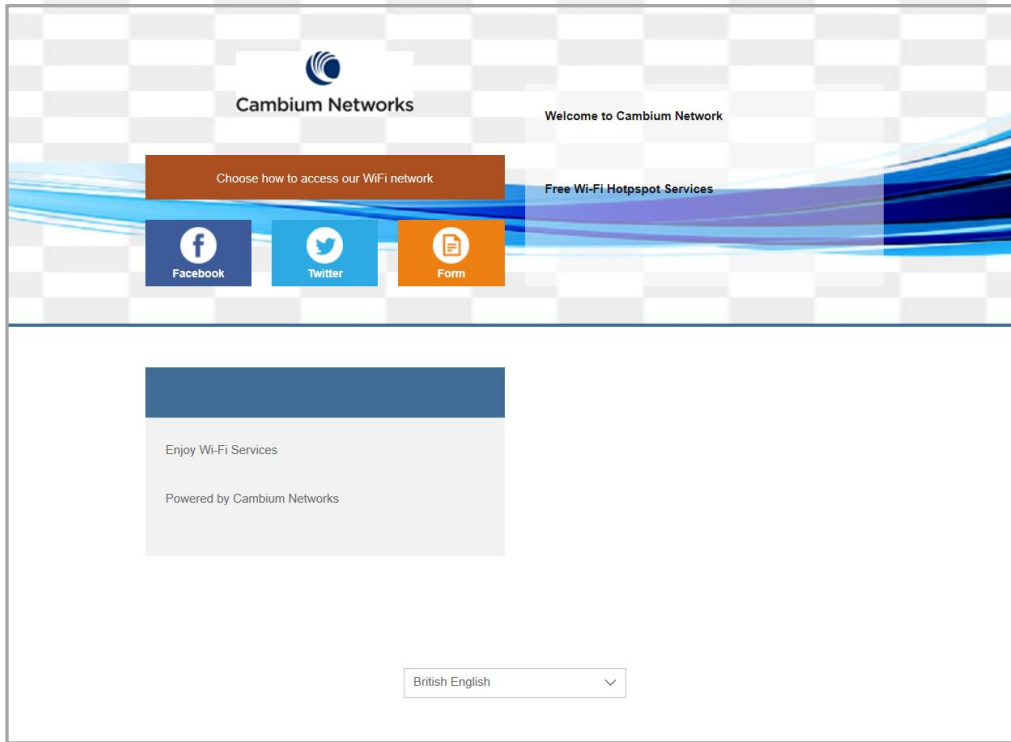

This section briefs about configuring different methods of External Guest Access captive portal services hosted on AP.

Access Policy - Clickthrough

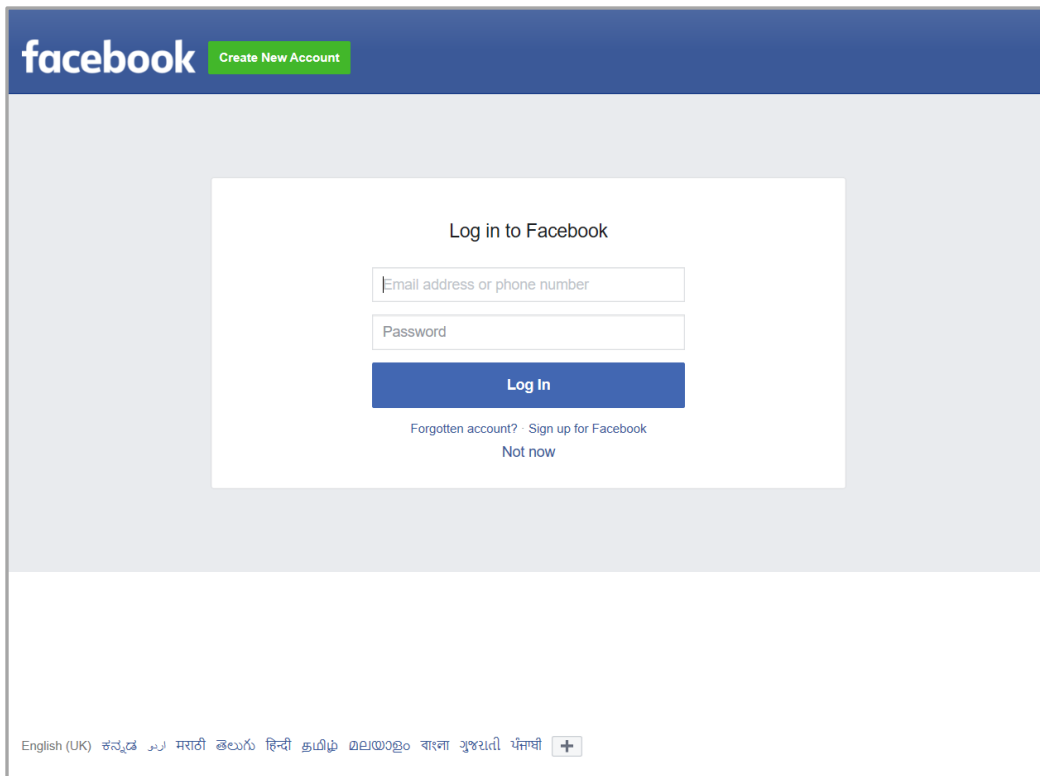

Configuration

Authentication – Redirected Splash Page

Successful Login – Redirected Splash Page

Chapter 18: Guest Access – cnMaestro

Cambium supports end-to-end Guest Access Portal services with combination of cnPilot and cnMaestro. cnMaestro supports various types of authentication mechanism for wireless clients to obtain Internet access. Following is an overview of types of Guest Access Portal services supported in cnMaestro:

- Free
 - Authentication Mechanisms
 - Social Login
 - ❖ Google
 - ❖ Twitter
 - ❖ Facebook
 - ❖ Office365
 - SMS Authentication
 - ❖ SMS Country
 - ❖ SMS Gupchup
 - ❖ Twilio
 - ❖ Victory Link SMS
 - ❖ Fast SMS
- Paid
 - Paypal Payment Gateway
 - Ippay Gateway
 - Quickpay Gateway
 - Orange Gateway
 - mPesa Gateway
- Voucher

This section describes how to configure Guest Access using cnMaestro.

Configurable Parameters

For Guest Access to be operational, both cnPilot and cnMaestro has to be configured for Guest Access Portal services. Below are the configurable parameters:

cnPilot

Figure 175 displays multiple configurable parameters supported for cnMaestro Guest Access hosted on AP.

Figure 175 Configure: WLAN > Guest Access > cnMaestro parameter

Basic
Radius Server
Guest Access
Usage Limits
Scheduled Access
Access
Passpoint
Delete

Enable

Portal Mode Internal Access Point External Hotspot **cnMaestro**

Guest Portal Name
Guest Portal Name which is hosted on cnMaestro

Redirect HTTP-only Enable redirection for HTTP packets only

Redirect User Page
Configure IP address for redirecting user to guest portal splash page

Proxy Redirection Port Port number(1 to 65535)

Inactivity Timeout Inactivity time in seconds (60 to 2592000)

MAC Authentication Fallback Use guest-access only as fallback for clients failing MAC-authentication

Extend Interface Configure the interface which is extended for guest access

Add Whitelist
Captive Portal bypass User Agent

IP Address or Domain Name

IP Address Domain Name	Action

cnMaestro

Table 61 lists configurable parameters that are available under **Services > Guest Access Portal** tab:

Table 61 Configure: Services > Guest Access > Basic parameters

Parameters	Description	Range	Default
Services > Guest Access Portal > <GAP Profile> Basic			
Name	Provision to configure the name of the Guest Access Portal services	–	–
Description	Provision to add brief details as per customer requirement	–	–
Client Login Event Logging	<p>Enabling this will provision cnMaestro to record all the client events and their details. Client details available when this is enabled are as follows:</p> <ul style="list-style-type: none"> • Client MAC • Portal • WLAN • Access Point • Voucher Code • Login Time • Access Type • Email • Mobile Number 	–	Disabled

Figure 176 Configure: Services > Guest Access > Basic parameters

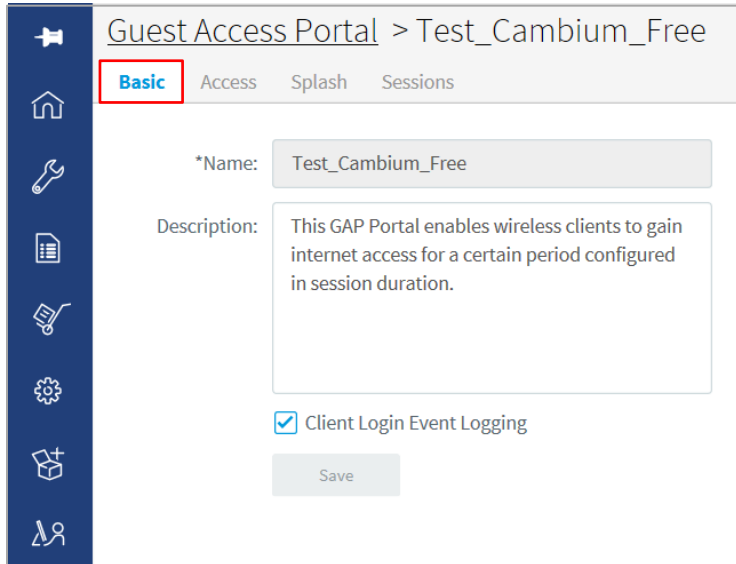

Table 62 Configure: Services > Guest Access > Access > Free parameters

Parameters	Description	Range	Default
Services > Guest Access Portal > <GAP Profile> Access > Free			
Enable Free Access	Provision to enable free internet access.	–	Disabled
Enable Logout Functionality for the guest client	Provision to provide user Internet access for complete session duration within renewal frequency. Internet access timer is calculated based on real time user has used. User can logout multiple times within renewal frequency.	–	Disabled
Bypass Captive Portal Detection	Provision to disable Captive Network Assistant (I).	–	Disabled
Services > Guest Access Portal > <GAP Profile> Access > Free > Client Session			
Session Duration	The duration for which the client is provided internet access.	1-2628000	–
Renewable Frequency	Once the session duration for the client expires, the client needs to wait for the period specified by renewal frequency before logging in again to obtain internet access.	1-2628000	–
Services > Guest Access Portal > <GAP Profile> Access > Free > Client Rate Limit			

Parameters	Description	Range	Default
Downlink	Provision to limit downlink speed from Access Point to wireless client when client is authenticated to gain internet access.	–	–
Uplink	Provision to limit uplink speed from wireless client to Access Point when client is authenticated to gain internet access.	–	–
Services > Guest Access Portal > <GAP Profile> Access > Free > Client Quota Limit			
Quota Type	Provision to limit the bandwidth of wireless client. Two categories are supported based on Data quantity: <ul style="list-style-type: none"> • Directional <ul style="list-style-type: none"> ○ Downlink ○ Uplink • Total 	–	None
Services > Guest Access Portal > <GAP Profile> Access > Free > Social Login			
Guest Portal Hostname / IP	Provision to configure the hostname that is share with supported social login website APIs. More details on supported social logins are provided in Social Login . For each type of Social login required, respective configuration parameters needs to be configured. These parameters vary based on Social Login.	–	Disabled
Services > Guest Access Portal > <GAP Profile> Access > Free > SMS Authentication			
Enable	Provision to enable SMS Authentication	–	Disabled
SMS Gateway Provider	Provision to configure SMS gateway. More details on supported SMS gateway are provided in SMS Authentication. For each type of Gateway vendors, configuration parameters vary and needs to be configured as per requirement.	–	–
Services > Guest Access Portal > <GAP Profile> Access > Free > Add Whitelist			
IP Address / Domain Name	Provision to allow internet traffic, when user is not authenticated.	–	–

Figure 177 Configure: Services > Guest Access > Access > Free parameters

Table 67 Configure: Services > Guest Access > Sessions parameters

Parameters	Description	Range	Default
Services > Guest Access Portal > <GAP Profile> Access > Sessions > Client Session			
Client MAC	Provides the MAC address of wireless client whose session is valid.	-	-
Access Point	Provides BSSID of radio to which wireless client is associated.	-	-

Parameters	Description	Range	Default
Access Type	Provides type of Guest Access Portal services enabled on wireless client. Following are the types: <ul style="list-style-type: none"> • Free • Type of Social Login • SMS • Type of Payment Gateway • Vouchers 		
WLAN	Displays SSID of WLAN to which wireless client is associated.	-	-
Remaining Time	The time left for the client to access the internet. It depends upon the session duration configured in the Access Portal.	-	-
Voucher	Displays Voucher code that has been used by wireless client for internet access.	-	-
Disconnect	Provision to disconnect wireless client on demand.	-	-
Services > Guest Access Portal > <GAP Profile> Access > Sessions > Client Login Events			
Client MAC	Provides the MAC address of wireless client whose session is valid.		
Portal	Displays Guest Access Portal associated with wireless client.		
WLAN	Displays SSID of WLAN to which wireless client is associated.		
Access Point	Provides BSSID of radio to which wireless client is associated.		
Voucher Code	Displays Voucher code that has been used by wireless client for internet access.		
Login Time	Displays time stamp of wireless client after a successful.		
Access Type	Provides type of Guest Access Portal services enabled on wireless client. Following are the types: <ul style="list-style-type: none"> • Free • Type of Social Login • SMS • Type of Payment Gateway 		

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> Vouchers 		
Email	Displays email address as provided by user during guest access portal authentication.		
Mobile Number	Displays mobile number as provided by user during guest access portal authentication.		
Services > Guest Access Portal > <GAP Profile> Access > Sessions > Client Paid Transactions			
Client MAC	Provides the MAC address of wireless client whose session is valid.		
Portal	Displays Guest Access Portal associated with wireless client.		
Plan	Displays plan name activated for user.		
Access Point	Provides BSSID of radio to which wireless client is associated.		
Voucher Code	Displays Voucher code that has been used by wireless client for internet access.		
Start Time	Displays timestamp when wireless client is successfully authenticated using Guest Access portal services.		
End Time	Displays valid session time based on configuration in Plan. This value is always equal to (Start Time + Duration).		
Transaction ID	Displays random value generated during payment process and can be used as reference for any debugging.

Configuration examples

Prerequisites:

- Create Guest Access Portal
 - Login to cnMaestro > Navigate to Services > Guest Access Portal > Add Portal.
 - Enter Portal Name, Description, enable Client Login Event Logging and click on Save.

Free

Configuration

1. Configure Guest Access portal enabled in pre-requisites for free internet access with pre-defined self-registration parameters.

Guest Access Portal > diva_GA

Basic **Access** Splash Sessions

The image shows a Google sign-in splash page. At the top left, there is a Google logo and the text "Sign in with Google". The main heading is "Sign in" followed by "Continue to camnwk.com". Below this is a text input field labeled "Email or phone" containing the email address "siti*****@gmail.com" and a clear button (X). Underneath the input field is a link "Forgot email?". A paragraph of text states: "To continue, Google will share your name, email address, language preference and profile picture with camnwk.com." At the bottom left is a link "Create account" and at the bottom right is a blue button labeled "Next".

Free – SMS Authentication

Configuration

1. Configure Guest Access portal enabled in pre-requisites for free internet access with SMA authentication.

Guest Access Portal > SIT_AUTOMATION_Google_FB_365

Access Internet

Congratulations your login is successful

Chapter 19: Policy Based VLAN Assignment (PBA)

Introduction

The PBA is intended to support zero-touch detection and configuration for connected Cambium devices (cnPilot AP's). New Cambium vendor specific LLDP TLVs are introduced starting with cnMatrix Release 2.1.0 to support "pushing" PBA policy data from Cambium devices (e.g., cnPilot) to cnMatrix. The new PBA TLVs are implemented as an extension to the LLDP standard, using its flexible extension mechanism. From a functional perspective, cnMatrix, acting as the upstream device, includes the PBA Authentication TLV in the regularly generated LLDPDUs for a port. The downstream device (e.g., cnPilot) receives the PBA Authentication TLV and, if policy action data (e.g., VLANs, native VLAN) is present to be pushed to cnMatrix, a PBA device settings TLV is constructed and added to the LLDPDU for the port.

Below table lists the fields that are required for configuring PBA:

Table 68 Configuring PBA parameters

Parameters	Description	Range	Default
lldp-pba	New PBA TLVs will be shared with cnMatrix switch.	-	Enabled
lldp-pba-auth-key	The shared private key used during PBA TLV authentication can be updated or reset from its default value (by using the 'no' option).	-	Enabled

Note

lldp-pba-auth-key is by default enabled; key value cannot be shared due to security concerns.

Configuration:

Syntax:

```
E410-0DA1AF(config)# ll
    lldp           : Enable periodic transmission of LLDP packets
    lldp-pba       : Enable PBA transmission in LLDP packets
    lldp-pba-auth-key : Configure the SHA-KEY passphrase ascii (must contain 8
to 63 ascii or characters)
```

Example:

```
E410-0DA1AF(config)#  
E410-0DA1AF(config)# show config | grep lld  
lldp  
lldp-pba  
  lldp-pba-auth-key $crypt$1$gwYqHt9rxt2FXeMsX1ljsFUKBupXtZcd  
E410-0DA1AF(config)#
```

**Note**

PBA will not be functioning if more than 20 VLANs are configured on the AP.

To disable PBA:

```
E410-0DA1AF(config)#  
E410-0DA1AF(config)# no lldp-pba
```

Chapter 20: Device Recovery Methods

Factory reset via 'RESET' button

Table 69 Factory reset via RESET button

cnPilot Access Point	Procedure	LED Indication
E400	Press and hold Reset button for 15 seconds	Both LEDs will be OFF and turned onto Amber
e410	Press and hold Reset button for 25 seconds	LED will be OFF and turned onto Amber
e410b	Press and hold Reset button for 25 seconds	LED will be OFF and turned onto Amber
e600	Press and hold Reset button for 20 seconds	LED will be OFF and turned onto Amber
e430	Press and hold Reset button for 25 seconds	LED will be OFF and turned onto Amber
e700	Press and hold Reset button for 25 seconds	Both LEDs will be OFF and turned onto Amber
E500	Press and hold Reset button for 25 seconds	Both LEDs will be OFF and turned onto Amber
E501S	Press and hold Reset button for 25 seconds	Both LEDs will be OFF and turned onto Amber
e502S	Press and hold Reset button for 25 seconds	Both LEDs will be OFF and turned onto Amber
e425H	Press and hold Reset button for 20 seconds	LED will be OFF and turned onto Amber
e505	Press and hold Reset button for 20 seconds	LED will be OFF and turned onto Amber
e510	Press and hold Reset button for 20 seconds	Both LEDs will be OFF and turned onto Amber

Factory reset via power cycle

Table 70 Factory reset via power cycle

cnPilot Access Point	Procedure
E400	Not Applicable
e410	Not Applicable
e410b	Not Applicable
e600	Not Applicable
e430	Not Applicable
e700	Not Applicable
E500	Follow power ON and OFF for 5 times with interval of 7 Sec (ON) and 5 Sec (OFF)
E501S	Follow power ON and OFF for 5 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e502S	Follow power ON and OFF for 5 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e425H	Not Applicable
e505	Not Applicable
e510	Not Applicable

To disable factory reset when above power sequence occurs, run the following CLI command:

```
E500-Factory_Reset(config)# no service powercycle-factory-default
E500-Factory_Reset(config)# save
```

Boot partition change via power cycle

Table 71 Boot partition change via power cycle

cnPilot Access Point	Procedure
E400	Follow power ON and off for 9 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e410	Follow power ON and off for 9 times with interval of 15 Sec (ON) and 5 Sec (OFF)
e410b	Follow power ON and off for 9 times with interval of 15 Sec (ON) and 5 Sec (OFF)
e600	Follow power ON and off for 9 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e430	Follow power ON and off for 9 times with interval of 15 Sec (ON) and 5 Sec (OFF)

e700	Follow power ON and off for 9 times with interval of 15 Sec (ON) and 5 Sec (OFF)
E500	Follow power ON and off for 9 times with interval of 7 Sec (ON) and 5 Sec (OFF)
E501S	Follow power ON and off for 9 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e502S	Follow power ON and off for 9 times with interval of 7 Sec (ON) and 5 Sec (OFF)
e425H	Follow power ON and off for 9 times with interval of 9 Sec (ON) and 5 Sec (OFF)
e505	Follow power ON and off for 9 times with interval of 9 Sec (ON) and 5 Sec (OFF)
e510	Follow power ON and off for 9 times with interval of 15 Sec (ON) and 5 Sec (OFF)

Glossary

Term	Definition
AP	Access Point Module. One module that distributes network or Internet services to subscriber modules.
API	Application Program Interface
ARP	Address Resolution Protocol. A protocol defined in RFC 826 to allow a network element to correlate a host IP address to the Ethernet address of the host.
BHM	Backhaul Timing Master (BHM)- a module that is used in a point to point link. This module controls the air protocol and configurations for the link.
BHS	Backhaul Timing Slave (BHS)- a module that is used in a point to point link. This module accepts configuration and timing from the master module.
BT	Bluetooth
DFS	See Dynamic Frequency Selection
DHCP	Dynamic Host Configuration Protocol defined in RFC 2131. Protocol that enables a device to be assigned a new IP address and TCP/IP parameters, including a default gateway, whenever the device reboots. Thus, DHCP reduces configuration time, conserves IP addresses, and allows modules to be moved to a different network within the system.
Ethernet Protocol	Any of several IEEE standards that define the contents of frames that are transferred from one network element to another through Ethernet connections.
FCC	Federal Communications Commission of the U.S.A.
GPS	Global Positioning System. A network of satellites that provides absolute time to networks on earth, which use the time signal to synchronize transmission and reception cycles (to avoid interference) and to provide reference for troubleshooting activities.
UI	User interface.
HTTP	Hypertext Transfer Protocol, used to make the Internet resources available on the World Wide Web.

Term	Definition
HTTPS	Hypertext Transfer Protocol Secure
HT	High Throughput
IP Address	32-bit binary number that identifies a network element by both network and host. See also Subnet Mask.
IPv4	Traditional version of Internet Protocol, which defines 32-bit fields for data transmission.
LUID	Logical Unit ID. The final octet of the 4-octet IP address of the module.
MAC Address	Media Access Control address. The hardware address that the factory assigns to the module for identification in the Data Link layer interface of the Open Systems Interconnection system. This address serves as an electronic serial number.
Maximum Information Rate (MIR)	The cap applied to the bandwidth of an SM or specified group of SMs. In the Cambium implementation, this is controlled by the Sustained Uplink Data Rate, Uplink Burst Allocation, Sustained Downlink Data Rate, and Downlink Burst Allocation parameters.
MIB	Management Information Base. Space that allows a program (agent) in the network to relay information to a network monitor about the status of defined variables (objects).
MIR	See Maximum Information Rate.
PPPoE	Point to Point Protocol over Ethernet. Supported on SMs for operators who use PPPoE in other parts of their network operators who want to deploy PPPoE to realize per-subscriber authentication, metrics, and usage control.
Proxy Server	Network computer that isolates another from the Internet. The proxy server communicates for the other computer, and sends replies to only the appropriate computer, which has an IP address that is not unique or not registered.
SLA	Service Level Agreement
VLAN	Virtual local area network. An association of devices through software that contains broadcast traffic, as routers would, but in the switch-level protocol.

Term	Definition
VPN	Virtual private network for communication over a public network. One typical use is to connect remote employees, who are at home or in a different city, to their corporate network over the Internet. Any of several VPN implementation schemes is possible. SMs support L2TP over IPSec (Level 2 Tunneling Protocol over IP Security) VPNs and PPTP (Point to Point Tunneling Protocol) VPNs, regardless of whether the Network Address Translation (NAT) feature enabled.
VHT	Very High Throughput
